*Click on the link in the table to view a video that shows instructional strategies for teaching each standard.*

These units were written to build upon concepts from prior units, so later units contain tasks that depend upon the concepts addressed in earlier units. All units will include the Mathematical Practices and indicate skills to maintain.

**NOTE:** Mathematical standards are interwoven and should be addressed throughout the year in as many different units and tasks as possible in order to stress the natural connections that exist among mathematical topics.

**Grade 9-12 Key:**

**Number and Quantity Strand:** RN = The Real Number System, Q = Quantities, CN = Complex Number System, VM = Vector and Matrix Quantities

**Algebra Strand:** SSE = Seeing Structure in Expressions, APR = Arithmetic with Polynomial and Rational Expressions, CED = Creating Equations, REI = Reasoning with Equations and Inequalities

**Functions Strand:** IF = Interpreting Functions, LE = Linear and Exponential Models, BF = Building Functions, TF = Trigonometric Functions

**Geometry Strand:** CO = Congruence, SRT = Similarity, Right Triangles, and Trigonometry, C = Circles, GPE = Expressing Geometric Properties with Equations, GMD = Geometric Measurement and Dimension, MG = Modeling with Geometry

**Statistics and Probability Strand:** ID = Interpreting Categorical and Quantitative Data, IC = Making Inferences and Justifying Conclusions, CP = Conditional Probability and the Rules of Probability, MD = Using Probability to Make Decisions

### Unit 1: Relationships Between Quantities

**MGSE9-12.A.SSE.1** Interpret expressions that represent a quantity in terms of its context.

**MGSE9-12.A.SSE.1a** Interpret parts of an expression, such as terms, factors, and coefficients.

**MGSE9-12.A.SSE.1b** Given situations which utilize formulas or expressions with multiple terms and/or factors, understand solving equations as a process of reasoning and explain the reasoning.

**MGSE9-12.A.REL.1** Use algebraic properties and the properties of real numbers, justify the steps of a simple, one-solution equation. Students should justify their own steps, or if given two or more steps of an equation, explain the progression from one step to the next using properties.

**MGSE9-12.A.REL.3** Solve linear equations and inequalities in one variable, including equations with coefficients represented by letters. For example, given $ax + 3 = 7$, solve for $x$.

**MGSE9-12.A.REL.5** Show and explain why the elimination method works to solve a system of two-variable equations.

**MGSE9-12.A.REL.6** Solve systems of linear equations exactly and approximately (e.g., with graphs), focusing on pairs of linear equations in two variables.

**MGSE9-12.A.REL.12** Graph the solution set to a linear inequality in two variables.

### Unit 2: Reasoning with Equations and Inequalities

**MGSE9-12.A.REL.10** Understand that the graph of an equation in two variables is the set of all its solutions plotted in the coordinate plane.

**MGSE9-12.A.REL.11** Using graphs, tables, or successive approximations, show that the solution to the equation $f(x) = g(x)$ is the $x$-value where the $y$-values of $f(x)$ and $g(x)$ are the same. Understand the concept of a function and use function notation.

**MGSE9-12.F.IF.1** Understand that a function from one set (the input, called the domain) to another set (the output, called the range) assigns to each element of the domain exactly one element of the range, i.e., each input value maps to exactly one output value. If $f$ is a function, $x$ is the input (an element of its domain), and $f(x)$ is the output (an element of the range). Graphically, the graph is $y = f(x)$.

**MGSE9-12.F.IF.2** Use function notation, evaluate functions for inputs in their domains, and interpret statements that use function notation in terms of a context.

**MGSE9-12.F.IF.3** Recognize that sequences are functions, sometimes defined recursively, whose domain is a subset of the integers. (Generally, the scope of high school math defines this subset as the set of natural numbers $1, 2, 3, 4, ...$) By graphing or calculating terms, students should be able to show how the recursive sequence $a_1 = 7, a_2 = a_1 + 2$; the sequence $s_n = 2(n^2 - 1)$; and the function $f(x) = 2x + 5$ (when $x$ is a natural number) all define the same sequence.

### Unit 3: Linear and Exponential Functions

**MGSE9-12.A.CED.1** Create equations and inequalities in one variable and use them to solve problems. Include equations arising from linear and exponential functions.

**MGSE9-12.A.REI.5** Show that two functions are not the same by creating equations with one or two variables.

**MGSE9-12.A.REI.11** Using graphs, tables, or successive approximations, show that the solution to the equation $f(x) = g(x)$ is the $x$-value where the $y$-values of $f(x)$ and $g(x)$ are the same. Understand the concept of a function and use function notation.

**MGSE9-12.F.IF.1** Understand that a function from one set (the input, called the domain) to another set (the output, called the range) assigns to each element of the domain exactly one element of the range, i.e., each input value maps to exactly one output value. If $f$ is a function, $x$ is the input (an element of its domain), and $f(x)$ is the output (an element of the range). Graphically, the graph is $y = f(x)$.

**MGSE9-12.F.IF.2** Use function notation, evaluate functions for inputs in their domains, and interpret statements that use function notation in terms of a context.

**MGSE9-12.F.IF.3** Recognize that sequences are functions, sometimes defined recursively, whose domain is a subset of the integers. (Generally, the scope of high school math defines this subset as the set of natural numbers $1, 2, 3, 4, ...$) By graphing or calculating terms, students should be able to show how the recursive sequence $a_1 = 7, a_2 = a_1 + 2$; the sequence $s_n = 2(n-1) + 7$; and the function $f(x) = 2x + 5$ (when $x$ is a natural number) all define the same sequence.

**MGSE9-12.F.IF.4** For a function that models a relationship between two quantities, interpret key features of graphs and tables in terms of the quantities, and sketch graphs showing key features given a verbal description of the relationship. Key features include: intercepts; intervals where the function is increasing, decreasing, positive, or negative; relative maximums and minimums; symmetries; end behavior; and periodicity. 

### Unit 4: Describing Data

**MGSE9-12.S.ID.1** Represent data on a single count or measurement variable.

**MGSE9-12.S.ID.2** Use statistics appropriate to the shape of the data distribution to compare center (median, mean) and spread (interquartile range, mean absolute deviation, standard deviation) of two or more different data sets.

**MGSE9-12.S.ID.3** Interpret differences in shape, center, and spread in the context of the data sets, accounting for possible effects of extreme data points (outliers).

**MGSE9-12.S.ID.4** Summarize, represent, and interpret data on two categorical and quantitative variables.

**MGSE9-12.S.ID.5** Summarize categorical data for two categories in two-way frequency tables. Interpret relative frequencies in the context of the data (including joint, marginal, and conditional relative frequencies).

**MGSE9-12.S.ID.6** Represent data on two quantitative variables on a scatter plot, and describe how the variables are related.

**MGSE9-12.S.ID.6a** Decide which type of function is most appropriate by observing graphed data, charted data, or by analysis of context to generate a viable (rough) function of best fit. Use this function to solve problems in context. Emphasize linear, quadratic, and exponential models.

**MGSE9-12.S.ID.6c** Given a rectangle, parallelogram, trapezoid, or regular polygon, describe the rotations and reflections that carry it onto itself.

**MGSE9-12.S.G.1** Develop definitions of rotations, reflections, and translations in terms of angles, circles, perpendicular lines, parallel lines, and line segments.

**MGSE9-12.S.G.5** Given a geometric figure and a rotation, reflection, or translation, draw the transformed figure using, e.g., graph paper, tracing paper, or geometry software. Specify a sequence of transformations that will carry a given figure onto another.
interpret the meaning (in context) of individual terms or factors.

Create equations that describe numbers or relationships

MGSE-9.A.CED.1 Create equations and inequalities in one variable and use them to solve problems. Include equations arising from linear and quadratic functions, and simple rational and exponential functions (integer inputs only).

MGSE-9.A.CED.2 Create linear and exponential equations in two or more variables to represent relationships between quantities; graph equations on coordinate axes with labels and scales. (The phrase “in two or more variables” refers to formulas like the compound interest formula, in which \( A = P(1 + r/n)^n \) has multiple variables.)

MGSE-9.A.CED.3 Represent constraints by equations or inequalities, and by systems of equations and/or inequalities, and interpret data points as possible (i.e. a solution) or not possible (i.e. a non-solution) under the established constraints.

MGSE-9.A.CED.4 Rearrange formulas to highlight a quantity of interest, using the same reasoning as in solving equations. Examples: Rearrange Ohm’s law \( V = IR \) to highlight resistance \( R \); rearrange the area of a circle formula \( A = \pi r^2 \) to highlight the radius \( r \).

Interpret functions that arise in applications in terms of the context

MGSE-9-A.F.IF.4 Using tables, graphs, and verbal descriptions, interpret the key characteristics of a function which models the relationship between two quantities. Sketch a graph showing key features including: intercepts; intervals where the function is increasing, decreasing, positive, or negative; relative maximums and minimums; symmetries; end behavior; and periodicity.

MGSE-9-A.F.IF.5 Relate the domain of a function to its graph and, where applicable, to the quantitative relationship it describes. For example, if the function \( h(n) \) gives the number of person-hours it takes to assemble \( n \) engines in a factory, then the positive integers would be an appropriate domain for the function.

MGSE-9-A.F.IF.6 Calculate and interpret the average rate of change of a function (presented symbolically or as a table) over a specified interval. Estimate the rate of change from a graph.

Analyze functions using different representations

MGSE-9-A.F.IF.7 Graph functions expressed symbolically and show key features of the graph, by hand in simple cases and using technology.

MGSE-9-A.F.IF.7a Graph linear and quadratic functions and show intercepts, maxima, and minima (as determined by the function or by context).

MGSE-9-A.F.IF.7e Graph exponential and logarithmic functions, showing intercepts and end behavior, and trigonometric functions, showing period, midline, and amplitude.

MGSE-9-A.F.IF.9 Compare properties of two functions each represented in a different way (algebraically, graphically, numerically in tables, or by verbal descriptions). For example, given a graph of one function and an algebraic expression for another, say which has the larger maximum.

Build a function that models a relationship between two quantities

MGSE-9-B.F.1 Write a function that describes a relationship between two quantities.

MGSE-9-B.F.1a Determine an explicit expression and the recursive process (steps for calculation) from collected bivariate data, fit a linear function for a scatter plot that suggests a linear association.

Interpret linear models

MGSE-9-S.ID.7 Interpret the slope (rate of change) and the intercept (constant term) of a linear model in the context of the data.

MGSE-9-S.ID.8 Compute (using technology) and interpret the correlation coefficient “\( r \)” of a linear fit. (For instance, by looking at a scatterplot, students should be able to tell if the correlation coefficient is positive or negative and give a reasonable estimate of the “\( r \)” value.) After calculating the line of best fit using technology, students should be able to describe how strong the goodness of fit of the regression is, using “\( r \)”.

MGSE-9-S.ID.9 Distinguish between correlation and causation.
context. For example, if Jimmy starts out with $15 and earns $2 a day, the explicit expression “$2x + 15” can be described recursively (either in writing or verbally) as “to find out how much money Jimmy will have tomorrow, you add $2 to his total today.”

\[ J_n = J_{n-1} + 2, J_0 = 15. \]

MGSE9-12.F.BF.2 Write arithmetic and geometric sequences recursively and explicitly, use them to model situations, and translate between the two forms. Connect arithmetic sequences to linear functions and geometric sequences to exponential functions.

**Build new functions from existing functions**

MGSE9-12.F.BF.3 Identify the effect on the graph of replacing \( f(x) \) by \( f(x) + k \), \( f(x-k) \), and \( f(kx) \) for specific values of \( k \) (both positive and negative); find the value of \( k \) given the graphs. Experiment with cases and illustrate an explanation of the effects on the graph using technology. Include recognizing even and odd functions from their graphs and algebraic expressions for them.

**Construct and compare linear, quadratic, and exponential models and solve problems**

MGSE9-12.F.LE.1 Distinguish between situations that can be modeled with linear functions and with exponential functions.

MGSE9-12.F.LE.1a Show that linear functions grow by equal differences over equal intervals and that exponential functions grow by equal factors over equal intervals. (This can be shown by algebraic proof, with a table showing differences, or by calculating average rates of change over equal intervals).

MGSE9-12.F.LE.1b Recognize situations in which one quantity changes at a constant rate per unit interval relative to another.

MGSE9-12.F.LE.1c Recognize situations in which a quantity grows or decays by a constant percent rate per unit interval relative to another.

MGSE9-12.F.LE.2 Construct linear and exponential functions, including arithmetic and geometric sequences, given a graph, a description of a relationship, or two input-output pairs (include reading these from a table).
**MGSE9-12.F.LE.3** Observe using graphs and tables that a quantity increasing exponentially eventually exceeds a quantity increasing linearly, quadratically, or (more generally) as a polynomial function.

**Interpret expressions for functions in terms of the situation they model**

**MGSE9-12.F.LE.5** Interpret the parameters in a linear \( f(x) = mx + b \) and exponential \( f(x) = a \cdot d^x \) function in terms of a context. (In the functions above, “\( m \)” and “\( b \)” are the parameters of the linear function, and “\( a \)” and “\( d \)” are the parameters of the exponential function.) In context, students should describe what these parameters mean in terms of change and starting value.

### Note

- **July 2019 ● Page 7 of 9**
descriptions of rigid motions to transform figures and to predict the effect of a given rigid motion on a given figure; given two figures, use the definition of congruence in terms of rigid motions to decide if they are congruent.  

**MGSE9-12.G.CO.7** Use the definition of congruence in terms of rigid motions to show that two triangles are congruent if and only if corresponding pairs of sides and corresponding pairs of angles are congruent.  

**MGSE9-12.G.CO.8** Explain how the criteria for triangle congruence (ASA, SAS, and SSS) follow from the definition of congruence in terms of rigid motions. (Extend to include HL and AAS.)  

**Prove geometric theorems**  

**MGSE9-12.G.CO.9** Prove theorems about lines and angles. Theorems include: vertical angles are congruent; when a transversal crosses parallel lines, alternate interior angles are congruent and corresponding angles are congruent; points on a perpendicular bisector of a line segment are exactly those equidistant from the segment’s endpoints.  

**MGSE9-12.G.CO.10** Prove theorems about triangles. Theorems include: measures of interior angles of a triangle sum to 180 degrees; base angles of isosceles triangles are congruent; the segment joining midpoints of two sides of a triangle is parallel to the third side and half the length; the medians of a triangle meet at a point.  

**MGSE9-12.G.CO.11** Prove theorems about parallelograms. Theorems include: opposite sides are congruent, opposite angles are congruent, the diagonals of a parallelogram bisect each other, and conversely, rectangles are parallelograms with congruent diagonals.  

**Make geometric constructions**  

**MGSE9-12.G.CO.12** Make formal geometric constructions with a variety of tools and methods (compass and straightedge, string, reflective devices, paper folding, dynamic geometric software, etc.). Copying a segment; copying an angle; bisecting a segment; bisecting an angle; constructing perpendicular lines, including the perpendicular bisector of a line segment; and constructing a line parallel to a given line through a point not on the line.  

**MGSE9-12.G.CO.13** Construct an cylinder, pyramid, and cone using Cavalieri’s principle.  

**MGSE9-12.G.GMD.2** Give an informal argument using Cavalieri’s principle for the formulas for the volume of a sphere and other solid figures.  

**MGSE9-12.G.GMD.3** Use volume formulas for cylinders, pyramids, cones, and spheres to solve problems.  

**Visualize relationships between two-dimensional and three-dimensional objects**  

**MGSE9-12.G.GMD.4** Identify the shapes of two-dimensional cross-sections of three-dimensional objects, and identify three-dimensional objects generated by rotations of two-dimensional objects.
| equilateral triangle, a square, and a regular hexagon, each inscribed in a circle. Use coordinates to prove simple geometric theorems algebraically. MGSE9-12.G.GPE.4 Use coordinates to prove simple geometric theorems algebraically. For example, prove or disprove that a figure defined by four given points in the coordinate plane is a rectangle; prove or disprove that the point $(1, \sqrt{3})$ lies on the circle centered at the origin and containing the point $(0,2)$. (Focus on quadrilaterals, right triangles, and circles.) |
