**IF YOU HAVE NOT READ THE KINDERGARTEN CURRICULUM OVERVIEW IN ITS ENTIRETY PRIOR TO USE OF THIS UNIT, PLEASE STOP AND CLICK HERE:**

Return to the use of this unit once you’ve completed reading the Curriculum Overview. Thank you.
OVERVIEW

Understand addition as putting together and adding to, and understand subtraction as taking apart and taking from.

For numbers 0 – 10, Kindergarten students choose, combine, and apply strategies for answering quantitative questions. This includes quickly recognizing the cardinalities of less sets of objects, counting and producing sets of given sizes, counting the number of objects in combined sets, or counting the number of objects that remain in a set after some are taken away. Objects, pictures, actions, and explanations are used to solve problems and represent thinking. Although GSE states, “Kindergarten students should see addition and subtraction equations, and student writing of equations in kindergarten is encouraged, but it is not required”, please note that it is not until First Grade when “Understand the meaning of the equal sign” is an expectation.

Mathematically proficient students communicate precisely by engaging in discussion about their reasoning using appropriate mathematical language. The terms students should learn to use with increasing precision with this cluster are: join, add, separate, subtract, and, same amount as, equal, less, more, compose, decompose.

The Critical Areas are designed to bring focus to the standards at each grade by describing the big ideas that educators can use to build their curriculum and to guide instruction.

(1) Representing, relating, and operating on whole numbers, initially with sets of objects. Students use numbers, including written numerals, to represent quantities and to solve quantitative problems, such as counting objects in a set; counting out a given number of objects; comparing sets or numerals; and modeling simple joining and separating situations with sets of objects, or eventually with equations, such as 5 + 2 = 7 and 7 – 2 = 5. (Kindergarten students should see addition and subtraction equations, and student writing of equations in kindergarten is encouraged, but it is not required.) Students choose, combine, and apply effective strategies for answering quantitative questions, including quickly recognizing the cardinalities of less sets of objects, counting and producing sets of given sizes, counting the number of objects in combined sets, or counting the number of objects that remain in a set after some are taken away.

For more detailed information about unpacking the content standards, unpacking a task, math routines and rituals, maintenance activities and more, please refer to the Grade Level Overview.
## Number Sense Trajectory – Putting It All Together

<table>
<thead>
<tr>
<th>Trajectory</th>
<th>Subitizing</th>
<th>Comparison</th>
<th>Counting</th>
<th>One-to-One Correspondence</th>
<th>Cardinality</th>
<th>Hierarchical Inclusion</th>
<th>Number Conservation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Being able to visually recognize a quantity of 5 or less.</td>
<td>Being able to compare quantities by identifying which has more and which has less.</td>
<td>Rote procedure of counting. The meaning attached to counting is developed through one-to-one correspondence.</td>
<td>Students can connect one number with one object and then count them with understanding.</td>
<td>Tells how many things are in a set. When counting a set of objects, the last word in the counting sequence names the quantity for that set.</td>
<td>Understands numbers are nested inside of each other and that the number grows by one each count. 9 is inside 10 or 10 is the same as 9 + 1.</td>
<td>The total number of objects remains the same when they are rearranged spatially. 5 is 4&amp;1 OR 3&amp;2.</td>
<td></td>
</tr>
</tbody>
</table>

### Each concept builds on the previous idea and students should explore and construct concepts in such a sequence

#### Number Relationships
- **Spatial Relationship**
  - **Patterned Set Recognition**
  - Students can learn to recognize sets of objects in patterned arrangements and tell how many without counting.

- **One and Two-More or Less**
  - Students need to understand the relationship of number as it relates to +/- one or two. Here students should begin to see that 5 is 1 more than 4 and that it is also 2 less than 7.

- **Understanding Anchors**
  - Students need to see the relationship between numbers and how they relate to 5s and 10s. 3 is 2 away from 5 and 7 away from 10.

- **Part-Part-Whole Relationship**
  - Students begin to conceptualize a number as being made up from two or more parts.

### Addition and Subtraction Strategies

#### One/Two More/Less
- **These facts are a direct application of the One/Two More/Less than relationships**

#### Make a Ten
- **Use a quantity from one addend to give to another to make a ten then add the remainder:**
  - \( 9 + 7 = 10 + 6 \)

#### Facts with Zero
- **Need to be introduced so that students don’t overgeneralize that answers to addition are always greater.**

#### Doubles
- **Many times students will use doubles as an anchor when adding and subtracting.**

---

*Developed by Graham Fletcher and adapted from: Clements & Sarama Learning and teaching early math: The learning trajectories approach (2009)*

*Van de Walle & Lovin Teaching Student Centered Mathematics (K-3)*
STANDARDS FOR MATHEMATICAL PRACTICE

The standards for Mathematical Practice describe varieties of expertise that mathematics educators at all levels should seek to develop in their students. These practices rest on important “processes and proficiencies” with longstanding importance in mathematics education. The statements provided offer a few examples of connections between the Standards for Mathematical Practice and the Content Standards of the unit. The list is not exhaustive and will hopefully prompt further reflection and discussion.

Students are expected to:

1. **Make sense of problems and persevere in solving them.** Students are able to compose and decompose numbers while solving problems involving addition and subtraction.
2. **Reason abstractly and quantitatively.** Students begin to draw pictures, manipulate objects, use diagrams or charts, etc. to express quantitative ideas such as a joining situation or separating situations.
3. **Construct viable arguments and critique the reasoning of others.** Students begin to clearly explain their thinking using mathematical language when composing and decomposing numbers. (Verbal and/or Written)
4. **Model with mathematics.** Students will begin to apply their mathematical thinking to real-world situations when given an addition or subtraction word problem.
5. **Use appropriate tools strategically.** Students will use manipulatives such as counting bears, cubes and number lines to model addition and subtraction problems.
6. **Attend to precision.** Students attend to the language of real-world situations to make sense of addition and subtraction problems.
7. **Look for and make use of structure.** Students begin to look for patterns and structure in the number system while exploring part-whole relationships using manipulatives.
8. **Look for and express regularity in repeated reasoning.** Students begin to recognize and use multiple strategies when combining and decomposing sets of numbers.

*(For descriptors of standard cluster please see the Grade Level Overview)*

***Mathematical Practices 1 and 6 should be evident in EVERY lesson***

STANDARDS FOR MATHEMATICAL CONTENT

Understand addition as putting together and adding to, and understand subtraction as taking apart and taking from

MGSEK.OA.1 Represent addition and subtraction with objects, fingers, mental images, drawings$, sounds (e.g., claps), acting out situations, verbal explanations, expressions, or equations.

MGSEK.OA.2 Solve addition and subtraction word problems, and add and subtract within 10, e.g., by using objects or drawings to represent the problem.
MGSE.K.OA.3 Decompose numbers less than or equal to 10 into pairs in more than one way, e.g., by using objects or drawings, and record each decomposition by a drawing or equation. (Drawings need not include an equation).

MGSE.K.OA.4 For any number from 1 to 9, find the number that makes 10 when added to the given number, e.g., by using objects or drawings, and record the answer with a drawing or equation.

MGSE.K.OA.5 Fluently add and subtract within 5.

All Rights Reserved
**BIG IDEAS**

- A *joining* problem involves three quantities: the starting amount, the change amount, and the resulting amount.
- A *separating* problem involves three quantities; the starting amount, the change amount (the amount being removed), and the resulting amount; however, the starting amount is the greatest amount with the change amount being removed which leaves the resulting amount.
- *Part-Part-Whole* problems involve three quantities: two parts that are combined into one whole
- *Compare* problems involve the comparison between two different quantities. The third quantity does not actually exist but is the difference between the two quantities. When one quantity is compared to another, the first quantity is either more than, less than, or equal to the second quantity.
- Problems can be solved in different ways.
- Problems can be modeled using objects, pictures, and words.
- Various combinations of numbers can be used to represent the same quantity.

(see table on previous page for examples)

**ESSENTIAL QUESTIONS**

- How can I represent and solve problem situations using objects, pictures, words and numbers?
- What happens when I join quantities together?
- What happens when sets are joined or separated?
- How can I use different combinations of numbers to represent the same quantity?
- How can using benchmark numbers help me when adding or subtracting?
- How can I use models to represent addition and subtraction?
- How can using benchmark numbers help me when adding or subtracting?
- Why is it important that I can build the number combinations for the number 5? 10?
- What happens when I decompose a quantity? How do you know when your answer makes sense?
Does the order of addends change the sum? How do you know when your answer makes sense?

CONCEPTS/SKILLS TO MAINTAIN

Although many students may have attended pre-school prior to entering kindergarten, this is the first year of school for some students. For that reason, no concepts/skills to maintain will be listed at this time. It is expected that teachers will differentiate to accommodate those students that may enter kindergarten with prior knowledge.

STRATEGIES FOR TEACHING AND LEARNING

Provide contextual situations for addition and subtraction that relate to the everyday lives of kindergarteners. A variety of situations can be found in children’s literature books. Students then model the addition and subtraction using a variety of representations such as drawings, sounds, acting out situations, verbal explanations and numerical expressions. Manipulatives, like two-color counters, clothespins on hangers, connecting cubes and stickers can also be used for modeling these operations. Kindergarten students should see addition and subtraction equations written by the teacher. Although students might struggle at first, teachers should encourage them to try writing the equations. Students’ writing of equations in Kindergarten is encouraged, but it is not required.

Create written addition or subtraction problems with sums and differences less than or equal to 10 using the numbers 0 to 10. It is important to use a problem context that is relevant to kindergarteners. After the teacher reads the problem, students choose their own method to model the problem and find a solution. Students discuss their solution strategies while the teacher represents the situation with an equation written under the problem. The equation should be written listing the numbers and symbols for the unknown quantities in the order that follows the meaning of the situation. The teacher and students should use the words equal and is the same as interchangeably.

Have students decompose numbers less than or equal to 5 during a variety of experiences to promote their fluency with sums and differences less than or equal to 5 that result from using the numbers 0 to 5. For example, ask students to use different models to decompose 5 and record their work with drawings or equations. Next, have students decompose 6, 7, 8, 9, and 10 in a similar fashion. As they come to understand the role and meaning of arithmetic operations in number systems, students gain computational fluency, using efficient and accurate methods for computing.

The teacher can use scaffolding to teach students who show a need for more help with counting. For instance, ask students to build a tower of 5 using 2 green and 3 blue linking cubes while you discuss composing and decomposing 5. Have them identify and compare other ways to make a tower of 5. Repeat the activity for towers of 7 and 9. Help students use counting as they explore ways to compose 7 and 9.

Fluency: Procedural fluency is defined as skill in carrying out procedures flexibly, accurately, efficiently, and appropriately. Fluent problem solving does not necessarily mean solving
problems within a certain time limit, though there are reasonable limits on how long computation should take. Fluency is based on a deep understanding of quantity and number.

**Deep Understanding**: Teachers teach more than simply “how to get the answer” and instead support students’ ability to access concepts from a number of perspectives. Therefore, students are able to see math as more than a set of mnemonics or discrete procedures. Students demonstrate deep conceptual understanding of foundational mathematics concepts by applying them to new situations, as well as writing and speaking about their understanding.

**Memorization**: The rapid recall of arithmetic facts or mathematical procedures. Memorization is often confused with fluency. Fluency implies a much richer kind of mathematical knowledge and experience.

**Number Sense**: Students consider the context of a problem, look at the numbers in a problem, make a decision about which strategy would be most efficient in each particular problem. Number sense is not a deep understanding of a single strategy, but rather the ability to think flexibly between a variety of strategies in context.

**Fluent students**:

- flexibly use a combination of deep understanding, number sense, and memorization.
- are fluent in the necessary baseline functions in mathematics so that they are able to spend their thinking and processing time unpacking problems and making meaning from them.
- are able to articulate their reasoning.
- find solutions through a number of different paths.

For more about fluency, see:

http://MGSEK.youcubed.org/wpcontent/uploads/2015/03/FluencyWithoutFear-2015.pdf and:

**SELECTED TERMS AND SYMBOLS**

The following terms and symbols are often misunderstood. These concepts are not an inclusive list and should not be taught in isolation. However, due to evidence of frequent difficulty and misunderstanding associated with these concepts, instructors should pay particular attention to them and how their students are able to explain and apply them.

The definitions below are for **teacher reference only** and are not to be memorized by students. Teachers should first present these concepts to students with models and real life examples. Students should understand the concepts involved and be able to recognize and/or use them with words, models, pictures, or numbers.

- Combine
- Compose
- Separate
- Decompose
- Compare
COMMON MISCONCEPTIONS

Students may over-generalize the vocabulary in word problems and think that certain words indicate solution strategies that must be used to find an answer. They might think that the word *more* always means to add and the words *take away* or *left* always means to subtract. When students use the words *take away* to refer to subtraction and its symbol, teachers need to repeat students’ ideas using the words *minus* or *subtract*. For example, students use addition to solve this Take from/Start Unknown problem: Seth took the 8 stickers he no longer wanted and gave them to Anna. Now Seth has 11 stickers *left*. How many stickers did Seth have to begin with?

If students progress from working with manipulatives to writing numerical expressions and equations, they skip using pictorial thinking. Students will then be more likely to use finger counting and rote memorization for work with addition and subtraction. Counting forward builds to the concept of addition while counting back leads to the concept of subtraction. However, counting is an inefficient strategy. Teachers need to provide instructional experiences so that students progress from the concrete level, to the pictorial level, then to the abstract level when learning mathematics.

TASKS

The following tasks represent the level of depth, rigor, and complexity expected of all Kindergarteners. These tasks or a task of similar depth and rigor should be used to demonstrate evidence of learning.

CONSTRUCTING TASK: Addition and Subtraction Word Problems

This task is intended to serve as a model for future tasks that you should create. “When children are learning about the operations of addition and subtraction, it’s helpful for them to see the connection between these processes and the world around them. Word problems accustom children to looking at groups of people or objects, help them see the actions of joining and separating, and give them experience figuring out sums and differences.” (Burns 2006)

STANDARDS FOR MATHEMATICAL CONTENT

Understand addition as putting together and adding to, and understand subtractions as taking apart and taking from

MGSEK.OA.1 Represent addition and subtraction with objects, fingers, mental images, drawings, sounds (e.g., claps), acting out situations, verbal explanations, expressions, or equations.

MGSEK.OA.2 Solve addition and subtraction word problems, and add and subtract within 10, e.g., by using objects or drawings to represent the problem.

MGSEK.OA.3 Decompose numbers less than or equal to 10 into pairs in more than one way, e.g., by using objects or drawings, and record each decomposition by a drawing or equation. (drawings need not include an equation).

MGSEK.OA.4 For any number from 1 to 9, find the number that makes 10 when added to the given number, e.g., by using objects or drawings, and record the answer with a drawing or equation.

MGSEK.OA.5 Fluently add and subtract within 5.

STANDARDS FOR MATHEMATICAL PRACTICE

1. Make sense of problems and persevere in solving them.
2. Reason abstractly and quantitatively.
3. Construct viable arguments and critique the reasoning of others.
4. Model with mathematics.
5. Use appropriate tools strategically.
6. Attend to precision.
7. Look for and make use of structure.
BACKGROUND KNOWLEDGE

As you tell the addition or subtraction stories, have children act out the stories using a variety of manipulatives to represent the people, animals, or objects. Once children are comfortable acting out the stories and demonstrate proficiency with acting them out, show students how to record matching number sentences. The minus sign should be read as “minus” or “subtract” **but not as “take away”**. The plus sign is easier since it is typically a substitute for “and” (Van de Walle, 2010).

As you create word problems for your students, base them on people, animals, or objects that you are discussing in other content areas or that the students can connect with for other reasons. Learning is tied to emotion and if students can connect with the problem, they are more likely to be engaged and therefore, learn through their experience.

This task is designed to serve as an example of how you should recreate this type of task frequently throughout the unit and the remainder of the school year with a variety of books. Since there are several word problem types and you want to allow time for students to explain their thinking, this type of task can be spread across a few math segments to allow for rich mathematical discussion about each problem type.

*For more information about common misconceptions, please refer to the unit overview.*

ESSENTIAL QUESTIONS

- How can I represent and solve problem situations using objects, pictures, words and numbers?

MATERIALS

- Sample *problem item* sheet to use as a guide
- *If You Give a Mouse a Cookie* by Laura Numeroff or any book that can be used to create word problems like the ones in the task chart
- Cookie shaped cereal for each student (or if using a different text, a variety of manipulatives for students to choose from)

GROUPING

Whole, Individual and/or Small group
TASK DESCRIPTION, DEVELOPMENT, AND DISCUSSION:

Read the story, *If You Give a Mouse a Cookie* (or any book you choose) to students. Give students individual bags of the cookie shaped cereal to use as a math tool for this task. Explain to the students that you will work together to solve Mouse’s problem (you may choose to have students work in pairs or small groups during other math segments and later individually once they become more proficient with problem solving in a variety of situations). Discuss each problem on the chart and the various strategies used to find the sum (doubles, finding five or ten, drawing pictures, acting out the story with manipulatives, etc.).

Select word problems from the problem type sheet and change them as you see necessary to reflect the concepts you are teaching in other academic areas. Remember, they should only include numbers up to 10. You could print a few to make a recording sheet so that students can represent their thinking on paper. You should make sure to expose students to a variety of structures (*join* problems, *separate* problems, *part-part-whole* problems, and *compare* problems) regularly so that they can develop proficiency with this type of problem-solving.

Also, do not expect that students will solve these problems in a single math segment. The emphasis is on the process, not the product. The goal is not only for a student to solve the problem, but rather for them to be able to explain their thinking through pictures, words, and numbers. Whatever they put on paper should explain what they did well enough to allow someone else to understand it (Van de Walle & Lovin 2006).

TEACHER REFLECTION QUESTIONS

- Can students separate objects from a greater set of objects?
- Are students able to explain what happens when some objects are removed from a set of objects? Added to a set of objects?
- Can students explain how to find out what is left when one quantity is removed from another?
- Can students explain patterns as the story develops?

FORMATIVE ASSESSMENT QUESTIONS

- What counting strategies did you use to separate (or combine) information?
- What is this story asking you to find out?
- What strategy will you use to solve this problem?
- Is there another way to solve this problem?

DIFFERENTIATION

Extension

- As students develop proficiency with solving each type of addition and subtraction structure, have them write their own problems for others to solve. Teachers should encourage students to write various types of problems for others to solve.
Intervention

- Allow students to work with numbers less than 5 so that they can practice using efficient strategies to solve the problems. Counting strategies are efficient at this stage, but will become inefficient and distracting as numbers become greater. As students begin to understand the relationships among numbers, they will begin learning number facts at a recall level (Carpenter et al. 1999).

### Compare3

(“How many more?” version):
- Spiders have 8 legs.
- Mice have 4 legs. How many more legs do spiders have than mice?

(“How many fewer?” version):
- Spiders have 8 legs.
- Mice have 4 legs. How many fewer legs do mice have than spiders?

(Version with “more”):
- Mice have 4 legs. Spiders have 4 more legs than mice. How many legs do spiders have?

(Version with “fewer”):
- Mice have 4 fewer legs than spiders. Spiders have 8 legs. How many legs do mice have?

(Version with “more”):
- Spiders have 8 legs. They have 4 more legs than mice. How many legs do mice have?

(Version with “fewer”):
- Mice have 4 fewer legs than spiders. Spiders have 8 legs. How many legs do mice have?

The tasks in this chart provide a variety of word problems using addition and subtraction for students to explore. It is not necessary for students to be able to solve ALL problem types in order to meet the standard for solving word problems using objects or drawings (MGSE.K.OA.2)
CONSTRUCTING TASK: Building Trains (Addition/Combining)

Approximately 1 day and repeated through centers (adapted from Chris Confer’s “Snap It” found in Teaching Number Sense)

STANDARDS FOR MATHEMATICAL CONTENT

MGSEK.OA.1 Represent addition and subtraction with objects, fingers, mental images, drawings, sounds (e.g., claps), acting out situations, verbal explanations, expressions, or equations.

MGSEK.OA.3 Decompose numbers less than or equal to 10 into pairs in more than one way, e.g., by using objects or drawings, and record each decomposition by a drawing or equation. (drawings need not include an equation).

MGSEK.OA.4 For any number from 1 to 9, find the number that makes 10 when added to the given number, e.g., by using objects or drawings, and record the answer with a drawing or equation.

MGSEK.OA.5 Fluently add and subtract within 5.

STANDARDS FOR MATHEMATICAL PRACTICE

1. Make sense of problems and persevere in solving them.
2. Reason abstractly and quantitatively.
3. Construct viable arguments and critique the reasoning of others.
4. Model with mathematics.
5. Use appropriate tools strategically.
6. Attend to precision.
7. Look for and make use of structure.
8. Look for and express regularity in repeated reasoning.

BACKGROUND KNOWLEDGE

“When parts of a set are known, addition is used to name the whole in terms of the parts.” (Van de Walle & Lovin 2006) Building Trains allows children to focus on a single number for the entire activity. It is important to give the children time to work on a single number (usually to 4 or 5, at first) throughout the activity, allowing them opportunities to explore through a variety of materials and methods of joining or separating. As their understanding of concepts develops, encourage students to expand their understanding with higher numbers. Allowing students multiple opportunities to participate in these types of activities gives them the chance to think about number relationships in a relaxed setting (Burns 2007; Van de Walle & Lovin 2006).

This activity reinforces the concept of addition (and the inverse, subtraction) through part-part-whole models. For students to see the two parts and the whole, the two parts must be kept as two
separate parts. For example, if using counters instead of connecting cubes, the two groups should be kept in separate piles or separated by color or using a part-part-whole mat.

For more information about common misconceptions, please refer to the unit overview.

ESSENTIAL QUESTIONS

• What happens when I join quantities together?

MATERIALS

• Connecting cubes (up to 10 per student) or other manipulatives (2-sided counters, shapes, dominoes, to name a few.)
• Ten Black Dots (Donald Crews 1986) or similar counting book
• Building Trains recording sheet

GROUPING

Whole, Individual and/or Small group task

TASK DESCRIPTION, DEVELOPMENT, AND DISCUSSION

Part 1 (Addition)
Before reading the book, Ten Black Dots by Donald Crews, or a similar book involving addition (see literature list for suggested titles), ask students to turn to a partner and show them “10” using their “math hands” (notice students who can show ten immediately and those who may count each finger or count on from 5 fingers). As you read, stop when you come to each number and ask students how many more black dots you would need to get to ten. (For example, on the page that says “…Two dots can make the eyes of a fox or the eyes of keys that open locks.” Say, “I see two black dots, how many more dots are needed to make ten?”)

Part II
After reading, begin an investigation to explore number relationships within 5 (and later within 10). Give each student five connecting cubes. Explain that when you say, “Break”, that is their cue to break the train of cubes into two equal parts. When they have separated their train of cubes, they will need to notice how many are in each group and share the combination they made with the class. Model for them how to share the combination (“I had 5 cubes. As I break my train in half, I am left with a set of 3 and a set of 2. So, 2 and 3 is equal to 5.”). Practice the activity with the class and have a few students share their combinations. Once you see that students understand the activity, assign partners and give each set of partners a sum of cubes to work with according to their abilities (numbers within 5 or 10). Students will take turns breaking their trains in two parts and show them to their partners. The partner will then say the combination aloud and repeat the process after switching roles.

Have students share their thoughts about the activity they participated in today. Have them share about any patterns they noticed during the activity (“3 + 2 is the same as 2 + 3. So, it doesn’t
matter the order of the addends, the sum is the same.”) and allow them to share their thinking. For students that have difficulty writing their math thinking, allow them to dictate to you or someone who can scribe their thoughts.

Part III (Five Tower Game)
“Five-Tower Game” (Burns 2007) Students will roll 2 dice, add the numbers that come up and build a tower with that many connecting cubes. Each partner repeats the process until five towers are made. Once the towers are made, the two students compare the number of cubes each person has. How do they know who has more? Less? In addition, questions such as the following can increase engagement in what seems to be a low level activity.

What is the greatest amount of cubes you could earn?  
What is the least amount of cubes you could earn?  
What is the difference in two towers?  
Can you use all your cubes and make 2 equal towers? Can you justify your thinking?

**TEACHER REFLECTION QUESTIONS**

- Can students explain their thinking when solving an addition problem?  
- How many different combinations are students able to create when adding to five?

**FORMATIVE ASSESSMENT QUESTIONS**

- Does the order of the addends change the sum? Can you explain your thinking?  
- How do you know when your answer makes sense?

**DIFFERENTIATION**

**Extension**

- “Two out of Three” Game (Activity 2.17, page 50. Van de Walle)

**Intervention**

- Allow students to work with numbers that are appropriate for their performance level. If students are still counting using one-to-one correspondence, you may suggest that they use numbers less than five. For those that seem to quickly identify number relationships to five, suggest numbers to ten until they can quickly identify number relationships within ten.  
- Allow students who are ready to record addition sentences to describe how they broke apart their trains.

**TECHNOLOGY**

CONSTRUCTING TASK: Building Trains (Subtraction)

Approximately 1 day and repeated through centers (adapted from Chris Confer’s “Snap It” found in Teaching Number Sense)

STANDARDS FOR MATHEMATICAL CONTENT

MGSE.K.OA.1 Represent addition and subtraction with objects, fingers, mental images, drawings\(^1\), sounds (e.g., claps), acting out situations, verbal explanations, expressions, or equations.

MGSE.K.OA.3 Decompose numbers less than or equal to 10 into pairs in more than one way, e.g., by using objects or drawings, and record each decomposition by a drawing or equation. (drawings need not include an equation).

MGSE.K.OA.5 Fluently add and subtract within 5.

STANDARDS FOR MATHEMATICAL PRACTICE

1. Make sense of problems and persevere in solving them.
2. Reason abstractly and quantitatively.
3. Construct viable arguments and critique the reasoning of others.
4. Model with mathematics.
5. Use appropriate tools strategically.
6. Attend to precision.
7. Look for and make use of structure.
8. Look for and express regularity in repeated reasoning.

BACKGROUND KNOWLEDGE

“In part-part-whole model, when the whole and one of the parts are known, subtraction names the other part.” (Van de Walle & Lovin 2006) Even when there is a remove action, the situation in this next activity ends with two clearly distinct parts. It is important for you to have a discussion with your students, which includes showing them how an addition and subtraction sentence can be written for the same situation, to help them connect addition and subtraction. (More information can be found in Chapter 3 of Teaching Student-Centered Mathematics: Grades K-3, Van de Walle & Lovin 2006)

For more information about common misconceptions, please refer to the unit overview.

ESSENTIAL QUESTIONS

- What happens when sets are joined or separated?
MATERIALS

- Connecting cubes (up to 10 per student) or other manipulatives (2-sided counters, shapes, dominoes, to name a few.)
- *Ten Black Dots* (Donald Crews 1986) or similar counting book
- Building Trains recording sheet

GROUPING

Whole, Individual and/or Small group task

TASK DESCRIPTION, DEVELOPMENT, AND DISCUSSION

Review the activity of *Breaking Trains* from the previous lesson. Ask them to share what patterns they may have noticed while working with the same number. After several students have had an opportunity to share, explain that this time, students will break their train and hide one of the parts behind their back. Their partner will have to identify the part shown and then predict the quantity of cubes that are behind their back. Once a prediction has been made, the partner with the cubes reveals how many are hidden for the other partner to check his or her thinking. They should both attempt to write the addition and subtraction sentence that describes the situation.

Before beginning, model the activity for the group. You will be “Player A” and the class will act as “Player B”. Using a set of ten, break the train and hide one part behind your back. All students will use their math hands to predict how many are behind your back (Scan to see who has made a logical prediction and those whose predictions are illogical. Intervention may be needed for those that demonstrate a lack of number sense.). After all students make a prediction with their math hands, reveal the number of cubes behind your back. Next, ask a volunteer to show the class how to write an addition and subtraction number sentence that would describe the situation you modeled. Encourage them to share their math thinking. Repeat this process until you feel that students are ready to practice this same activity with a partner.

Once students are ready, assign each set of partners a number that is appropriate for their performance level and allow them to begin working. As you walk around and observe partners working together, stop and ask students some of the following questions (or similar questions to assess student learning)

- (as students show one part of cubes and hide the other part) What goes with (known part) to make _ (known whole) _? Or _ (known part) _ and ? make _ (known whole) _?
- What strategies did you use to find your answer?

Have students share their math strategies they used to determine how many cubes were missing. Have them share any patterns they noticed during the activity and allow them to share their thinking. For students that have difficulty sharing their math thinking, allow them to show their thinking.
TEACHER REFLECTION QUESTIONS

- Can students explain their thinking when solving a subtraction problem?

FORMATIVE ASSESSMENT QUESTIONS

- How do you know when your answer makes sense?

DIFFERENTIATION

Extension

- “Grab Bag Subtraction”-adapted (Burns 2007) Children can work in pairs or independently for this activity. Fill a paper bag with any set of tiles or cubes (to 5 or 10) and write the quantity of items in the bag on the front of the sack. Students will reach in the bag and take some out, showing how many were removed. Both students will predict how many they think are left inside of the bag. Then they will check their predictions and record the addition and subtraction number sentences.

Intervention

- Students may use a part-part-whole mat for this activity and cover an addend with a sheet of paper. Make sure that students flip the mat so that the “whole” section is first, showing that one part is removed from the whole. An example of a part part whole mat can be seen below.

```
     whole

  part   part
```

STANDARDS FOR MATHEMATICAL CONTENT

MGSE.K.OA.1 Represent addition and subtraction with objects, fingers, mental images, drawings\(^1\), sounds (e.g., claps), acting out situations, verbal explanations, expressions, or equations.

MGSE.K.OA.2 Solve addition and subtraction word problems, and add and subtract within 10, e.g., by using objects or drawings to represent the problem.

MGSE.K.OA.3 Decompose numbers less than or equal to 10 into pairs in more than one way, e.g., by using objects or drawings, and record each decomposition by a drawing or equation. (drawings need not include an equation).

MGSE.K.OA.4 For any number from 1 to 9, find the number that makes 10 when added to the given number, e.g., by using objects or drawings, and record the answer with a drawing or equation.

MGSE.K.OA.5 Fluently add and subtract within 5.

STANDARDS FOR MATHEMATICAL PRACTICE

1. Make sense of problems and persevere in solving them.
2. Reason abstractly and quantitatively.
3. Construct viable arguments and critique the reasoning of others.
4. Model with mathematics.
5. Use appropriate tools strategically.
6. Attend to precision.
7. Look for and make use of structure.
8. Look for and express regularity in repeated reasoning.

BACKGROUND KNOWLEDGE

Students need to develop an understanding of part-whole relationships as they recognize that a set of objects (5) can be broken into less sub-sets (3 and 2) and still remain the total amount (5). In addition, this objective asks students to realize that a set of objects (5) can be broken in multiple ways (3 and 2; 4 and 1). Thus, when breaking apart a set (decompose), students use the understanding that a less set of objects exists within that greater set (inclusion).

Use of the recording sheet for this task is optional because students need to learn to draw a representation of what they are thinking for three reasons:

*SMP2. Reason abstractly and quantitatively.*
SMP3. Construct viable arguments and critique the reasoning of others.
SMP4. Model with mathematics.

By encouraging students to organize their work and draw representations, students can begin to “talk through” their process. This enables students the opportunity to attend to precision as they explain and reason mathematically. Using tables, numbers, pictures and words allows students to become more efficient when identifying patterns in numbers and making generalizations.

Commutative property might be identified during this task. Have students discuss whether or not to include commutative properties as possible combinations. Since there are no right or wrong answers, students should construct viable arguments and explain why their combination of bananas is correct. In addition, students must be willing to analyze and critique the reasoning of others.

For more information about common misconceptions, please refer to the unit overview.

ESSENTIAL QUESTIONS

- How can I use different combinations of numbers to represent the same quantity?

MATERIALS

- Paper
- Pencil
- Accessible manipulatives
- 2 bowls per group/student

GROUPING

Whole, Individual and/or Small group task

TASK DESCRIPTION, DEVELOPMENT AND DISCUSSION

It is useful to think of problem-based lessons as consisting of three main parts: before, during, and after. If you allot time for each part it is quite easy to devote a full period to one seemingly simple problem. (Van de Walle p.15-19)

The Before Phase: get students mentally prepared for the task, be sure the task is understood, and be certain that you have clearly established expectations beyond simply getting an answer.

The During Phase: the most important thing here is let go! Give students a chance to work without your guidance. Give them an opportunity to use their ideas and not simply follow directions. It is also important to listen. Find out how different children or groups are thinking, what ideas they are using, and how they are approaching the problem. In this phase hints may be provided but not solutions, and students should be encouraged to test ideas.
The After Phase: this is often where some of the best learning takes place. During the after phase students share emerging ideas and the community of class learners is developed. This will not develop quickly or easily and will be developed over time.

(For a more detailed description of the three-phase problem-based learning model see Van de Walle Teaching Student-Centered Mathematics K-3 pp 15-19)

The task presented to students is as follows:

*The monkeys loved to pick bananas. They loved to count their bananas and put them into baskets. If the monkeys picked 5 bananas one morning, what are all the possible ways they could put the bananas into baskets? Explain and justify.*

Possible solutions for decomposing 5 (The concept of commutative property can be explored but only if it is discovered by students.

\[
\begin{align*}
5 &= 3 + 2 \\
5 &= 2 + 3 \\
5 &= 4 + 1 \\
5 &= 1 + 4 \\
5 &= 5 + 0 \\
5 &= 0 + 5 \\
\end{align*}
\]

**TEACHER REFLECTION QUESTIONS**

- Can students explain their thinking when solving an addition or subtraction problem?
- How many different combinations are students able to create when adding to five?

**FORMATIVE ASSESSMENT QUESTIONS**

- Are there any more ways to compose or decompose the number 5? How do you know?
- Why did you decide to do it this way?
- Are you sure that you have found them all? Why do you think so? How do you know?
- Did you develop a shortcut to find your answers?
- Did you identify any patterns or rules? Can you explain them?
- What is the most number of baskets the monkeys could use?
- What is the fewest number of baskets the monkeys could use?

**DIFFERENTIATION**

**Extension**

- Students can be encouraged to find the solution for multiple quantities up to 10 bananas. In addition, students can create a story problem using a quantity of 5.
The standard addresses pairs of numbers to 5, teaching open ended word problems in a context allow students to go above and beyond the expectation of the standards.

\[
\begin{align*}
5 &= 1 + 1 + 1 + 1 + 1 \\
5 &= 2 + 1 + 1 + 1 + 0 \\
5 &= 2 + 2 + 1 + 0 + 0 \\
5 &= 3 + 1 + 1 + 0 + 0 \\
5 &= 3 + 2 + 0 + 0 + 0 \\
5 &= 4 + 1 + 0 + 0 + 0 \\
5 &= 5 + 0 + 0 + 0 + 0
\end{align*}
\]

**Intervention**

- Allow students to work through the stages at a speed that is appropriate for their performance level. Some students may need additional experiences acting out problems, using manipulatives, or drawing pictures.
- Students can use cut out pictures of bananas and act out the story by placing the cut outs in bowls or pictures of bowls.
- Start with a number less than 5 and allow students to build and generalize with the patterns that they are seeing. In addition, you could limit the number of baskets that a student uses.

[Back to Intervention Table]

**TECHNOLOGY**

Brainie: Students find different combinations to build a number

Going Bananas

The monkeys loved to pick bananas and put them into two baskets. If the monkeys picked 5 bananas one morning, what are all the possible ways they could put their bananas into baskets? Explain and justify.
Going Bananas

The monkeys loved to pick bananas and put them into two baskets. If the monkeys picked 10 bananas one morning, what are all the possible ways they could put their bananas into baskets? Explain and justify.
PRACTICE TASK: Tug-O-War  
Approximately one day and repeated through centers

STANDARDS FOR MATHEMATICAL CONTENT

MGSE.K.OA.1 Represent addition and subtraction with objects, fingers, mental images, drawings\(^1\), sounds (e.g., claps), acting out situations, verbal explanations, expressions, or equations.

MGSE.K.OA.4 For any number from 1 to 9, find the number that makes 10 when added to the given number, e.g., by using objects or drawings, and record the answer with a drawing or equation.

STANDARDS FOR MATHEMATICAL PRACTICE

1. Make sense of problems and persevere in solving them.
2. Reason abstractly and quantitatively.
3. Construct viable arguments and critique the reasoning of others.
4. Model with mathematics.
5. Use appropriate tools strategically.
6. Attend to precision.
7. Look for and make use of structure.
8. Look for and express regularity in repeated reasoning.

BACKGROUND KNOWLEDGE

Many children will use number lines (models) to solve story problems. The model is a thinking tool to help them both understand what is happening in the problem and a means of keeping track of the numbers and solving the problem. Tug-O-War is a task that helps students become familiar with adding and subtracting along number line. (Van de Walle p.72-72)

For more information about common misconceptions, please refer to the unit overview.

ESSENTIAL QUESTIONS

- How can using benchmark numbers help me when adding or subtracting?
- How can I use models to represent addition and subtraction?

MATERIALS

- 1 counter
- Spinner
- Tug-O-War game board
GROUPING

Partners (2 players)

TASK DESCRIPTION, DEVELOPMENT AND DISCUSSION

Place the counter at the number 5 on the number line.

Player 1 spins the spinner and moves the counter the corresponding number of spaces towards zero on the number line. (If the chip is on five and player 1 spins a 3 they move the chip 3 spaces to 2) Player 1 must identify and say the number of where the chip is on the number line. If player 1 is unable to correctly identify the correct location of the chip, it moves back to the previous location.

While the game is being played students should use a ten frame to model what is happening to the counter on the number line which in turn will help with strategy development. Although writing the equation is NOT a standard that is explicitly listed in Kindergarten, it is suggested that students be provided with lots of opportunities to record their thinking. Students can record the results of their turn in their journal.

Player 2 spins the spinner and moves the counter that many spaces towards 10. (If the chip is on 7 and player 2 spins a 3, they move the chip 3 spaces to 10) If player 2 is unable to identify the correct location of the chip, it moves back to the previous location.

If the chip reaches zero on the number line, player 1 wins. If the chip reaches 10 on the number line, player 2 wins.

TEACHER REFLECTION QUESTIONS

• How are students moving the counter on the number line?
• Are students counting by ones? Or are students using a new strategy?
• Do students use the benchmark numbers to count forwards or backwards to determine the location of their counter?

FORMATIVE ASSESSMENT QUESTIONS

• Instead of counting 1 by 1, could you have located the counter a different way?
• Are you using any strategies to help you find where the counter should be placed?
• Did you use the benchmark numbers to locate the place on the number line?
• Where is the counter located on the number line right now? How do you know?
• Did you develop a shortcut to find your answers?
• Did you identify any patterns when playing the game?
DIFFERENTIATION

Extension

- 2 six-sided die could be used to extend the game. Have players roll the dice, determine the answer and move the corresponding number of spaces.

Intervention

- The numerals can be written on the Tug-O-War game board to help assist students that struggle with identifying the location on the number line.

Back to Intervention Table

TECHNOLOGY

Addition Games-Arrgh! Pirate Platform: Students add two addends to find a quantity while traveling through a pirate ship

http://MGSEK.fun4thebrain.com/addition/arrgh.html
Materials
1 counter and spinner numbered (1-3)

Directions
1. Place the counter at the number 10 on the number line.
2. Player 1 spins the spinner and moves the counter the corresponding number of spaces towards zero on the number line. (If the chip is on five and player 1 spins a 3 they move the chip 3 spaces to 5) Player one must identify and say the number of where the chip is on the number line. If player 1 is unable to correctly identify the correct location of the chip, it moves back to the previous location.
3. Player 2 spins the spinner and moves the counter that many spaces towards 10. (If the chip is on 7 and player 2 spins 2 they move the chip 2 places to 9) If player 2 is unable to correctly identify the correct location of the chip, it moves back to the previous location.
4. If the chip reaches zero on the number line, player 1 wins. If the chip reaches 10 on the number line, player 2 wins.
PRACTICE TASK: Race To 20 Revisited

Approximately one day and repeated through centers

STANDARDS FOR MATHEMATICAL CONTENT

MGSE.K.OA.1 Represent addition and subtraction with objects, fingers, mental images, drawings, sounds (e.g., claps), acting out situations, verbal explanations, expressions, or equations.

MGSE.K.OA.5 Fluently add and subtract within 5.

STANDARDS FOR MATHEMATICAL PRACTICE

1. Make sense of problems and persevere in solving them.
2. Reason abstractly and quantitatively.
3. Construct viable arguments and critique the reasoning of others.
4. Model with mathematics.
5. Use appropriate tools strategically.
6. Attend to precision.
7. Look for and make use of structure.
8. Look for and express regularity in repeated reasoning.

BACKGROUND KNOWLEDGE

In this task students will roll the dice and make a 5. If a student rolls a 3 they would need 2 more to make a 5, so they move 2 spaces. Students will eventually roll a 6. This will provide an opportunity for class discussion and for students to engage in SMP3. In order to make a 5 from 6, one would need to be removed. Have students discuss how this could be represented in the game (move backwards one space).

For more information about common misconceptions, please refer to the unit overview.

ESSENTIAL QUESTIONS

- How can using benchmark numbers help me when adding or subtracting?

MATERIALS

- 2 different colored counters
- 1 number cube (1-6)
- Race to 20 game board

GROUPING

Partners (2 players)
TASK DESCRIPTION, DEVELOPMENT AND DISCUSSION

Each player places their counter in the starting square.

Player one rolls the dice and moves as many spaces needed to make a 5. Example: 3 rolled, move forward 2 places. 4 rolled move forward 1.

Players must correctly identify what number square they are on and how they know or return back to the previous square.

Players alternate turns until one player reaches 20.

TEACHER REFLECTION QUESTIONS

- Are students counting by ones? Or are students using a new strategy?
- Do students use the benchmark numbers to count forwards or backwards to determine the location of their counter?

FORMATIVE ASSESSMENT QUESTIONS

- Instead of counting 1 by 1, could you have located the counter a different way?
- Are you using any strategies to help you find where the counter should be placed?
- Did you use benchmark numbers to locate the place on the board?
- Where is the counter located on the board right now? How do you know?
- Did you develop a shortcut to find your answers?
- Did you identify any patterns when playing the game?

DIFFERENTIATION

Extension

(2) sixed-sided dice could be used to extend the game. Have players roll the dice, determine the answer and move the corresponding number of spaces on the board.

Intervention

While the game is being played students can use a five-frame to model what is happening to the counter. This can also be beneficial for students that struggle to identify strategies.

Back to Intervention Table
Race to 20

Materials:
- 2 different colored counters
- 1 number cube (1-6)

Directions:
- Each player places their counter in the starting square.
- Player one rolls the dice and moves as many spaces needed to make a 5. Example: 3 rolled move forward 2 places. 4 rolled move forward 1 place.
- Players must correctly identify what number square they are on and how they know, or return back to the previous square.
- Players alternate turns until one player reaches 20.
CONSTRUCTING TASK: Shake and Spill Addition (5 Or 10)

Approximately one day and repeated through centers (adapted from Marilyn Burns’ Shake and Spill activity found in About Teaching Mathematics: A K-8 Resource)

STANDARDS FOR MATHEMATICAL CONTENT

MGSEK.OA.1 Represent addition and subtraction with objects, fingers, mental images, drawings, sounds (e.g., claps), acting out situations, verbal explanations, expressions, or equations.

MGSEK.OA.3 Decompose numbers less than or equal to 10 into pairs in more than one way, e.g., by using objects or drawings, and record each decomposition by a drawing or equation. (drawings need not include an equation).

MGSEK.OA.4 For any number from 1 to 9, find the number that makes 10 when added to the given number, e.g., by using objects or drawings, and record the answer with a drawing or equation.

MGSEK.OA.5 Fluently add and subtract within 5.

STANDARDS FOR MATHEMATICAL PRACTICE

1. Make sense of problems and persevere in solving them.
2. Reason abstractly and quantitatively.
3. Construct viable arguments and critique the reasoning of others.
4. Model with mathematics.
5. Use appropriate tools strategically.
6. Attend to precision.
7. Look for and make use of structure.
8. Look for and express regularity in repeated reasoning.

BACKGROUND KNOWLEDGE

“When parts of a set are known, addition is used to name the whole in terms of the parts.” (Van de Walle & Lovin 2006) Shake and Spill allows children to focus on a single number for the entire activity. It is important to give the children time to work on a single number (usually to 4 or 5, at first) throughout the activity, allowing them opportunities to explore through a variety of materials and methods of joining or separating. As their understanding of concepts develop, encourage students to extend their understanding with higher numbers. Allowing students multiple opportunities to participate in these types of activities gives them the chance to think about number relationships in a relaxed setting (Burns 2007; Van de Walle & Lovin 2006).
This activity reinforces the concept of addition (and the inverse, subtraction) through part-part-whole models. For students to see the two parts and the whole, the two parts must be kept as two separate parts.

For more information about common misconceptions, please refer to the unit overview.

**ESSENTIAL QUESTIONS**

- Why is it important that I can build the number combinations for the number 5? 10?

**MATERIALS**

- Two-color counters
- One small cup, per student (like a mouthwash cup)
- One dry-erase marker per student
- Shake and Spill recording sheet for addition
- *Anno’s Counting House* by Mitsumasa Anno, or another similar counting book

**GROUPING**

Whole, individual, and/or small group task

**TASK DESCRIPTION, DEVELOPMENT AND DISCUSSION**

Begin this task by “reading” the math picture book, *Anno’s Counting House* (Anno 1982) or a similar book. As some of the children in the story move to the other house, ask questions such as, “Who’s gone? How many are gone? If ____ are gone, how many must be in the first house?”

With rich conversation during this story, all combinations of ten will be discussed.

After reading, begin an investigation to explore number relationships within 5 (and later within 10). Give each student a cup of five double-sided counters. Ask students to swirl the cup of counters and then spill them on their table or work space. How many red counters do you see? How many yellow? Then show students how to record what they see using a number sentence. Allow them to write on their table, using their dry-erase marker, the same number sentence. Repeat this process until you see that a majority of your students are ready to practice on their own.

When showing students how to record a number sentence, make sure to identify all the parts: the addends, the equal sign (can be read, “the same as”), and the answer to an addition number sentence, or sum. Take care to ensure that students can differentiate between the term “sum” and the word “some”. Once students demonstrate an understanding of the activity, allow them to do the activity on their own. Assign each student a number of counters to work with according to his or her ability level (5 or 10). Each student will swirl and spill the counters in his cup, draw what they see, and write a number sentence that describes what is shown.
Possible solutions: 5=0+5, 5+0=5, 4+1=5, 1+4=5, 3+2=5, 2+3=5
10+0=10, 0+10=10, 9+1=10, 1+9=10, 8+2=10, 2+8=10, 7+3=10,
3+7=10, 6+4=10, 4+6=10, 5+5=10

Possible questions that engage students:
When recording the number of red sides and yellow sides each time you spill the counters, do you think you’ll get one result more often than others?
If so, what will it be? How do you know?

TEACHER REFLECTION QUESTIONS

- How many number combinations were students able to make with 5 or 10?
- What did they notice about the combinations?

FORMATIVE ASSESSMENT QUESTIONS

- Does the order of the addends change the sum? Can you explain your thinking?
- How do you know when your answer makes sense?

DIFFERENTIATION

Extension
- Play, “Five-Frame Tell-About” (Van de Walle, page 46). This game could also be changed to “Ten-Frame Tell-About”.

Intervention
- Allow students who have difficulty with organization to use a 5 or 10s frame. As they spill the counters, have them fill up the frames with the counters and then record their findings.
- Students may use a part-part-whole mat for this activity. An example of part-part-whole mat can be seen below.

CONSTRUCTING TASK: Shake and Spill Subtraction (5 Or 10)

Approximately one day and repeated through centers (adapted from Marilyn Burns’ Shake and Spill activity found in About Teaching Mathematics: A K-8 Resource

STANDARDS FOR MATHEMATICAL CONTENT

MGSE.K.OA.1 Represent addition and subtraction with objects, fingers, mental images, drawings\(^1\), sounds (e.g., claps), acting out situations, verbal explanations, expressions, or equations.

MGSE.K.OA.3 Decompose numbers less than or equal to 10 into pairs in more than one way, e.g., by using objects or drawings, and record each decomposition by a drawing or equation. (drawings need not include an equation).

MGSE.K.OA.4 For any number from 1 to 9, find the number that makes 10 when added to the given number, e.g., by using objects or drawings, and record the answer with a drawing or equation.

MGSE.K.OA.5 Fluently add and subtract within 5.

STANDARDS FOR MATHEMATICAL PRACTICE

1. Make sense of problems and persevere in solving them.
2. Reason abstractly and quantitatively.
3. Construct viable arguments and critique the reasoning of others.
4. Model with mathematics.
5. Use appropriate tools strategically.
6. Attend to precision.
7. Look for and make use of structure.
8. Look for and express regularity in repeated reasoning.

BACKGROUND KNOWLEDGE

“In part-part-whole model, when the whole and one of the parts are known, subtraction names the other part.” (Van de Walle & Lovin 2006) Even when there is a remove action, the situation in this next activity ends with two parts clearly distinct. It is important for you to have a discussion with your students, which includes showing them how an addition and subtraction sentence can be written for the same situation, to help them connect addition and subtraction. (More information can be found in Chapter 3 of Teaching Student-Centered Mathematics: Grades K-3, Van de Walle & Lovin 2006)

_For more information about common misconceptions, please refer to the unit overview._
ESSENTIAL QUESTIONS

- What happens when I decompose a quantity? How do you know when your answer makes sense?

MATERIALS

- Two-color counters
- One small cup, per student (like a mouthwash cup)
- One dry-erase marker per student
- Shake and Spill recording sheet for subtraction
- *Anno’s Counting House* by Mitsumasa Anno, or another similar counting book

GROUPING

Whole, individual and/or small group task

TASK DESCRIPTION, DEVELOPMENT AND DISCUSSION

Review the activity of *Shake and Spill* from the previous lesson. Ask students to share what patterns they may have noticed while working with the same number. After several students have had an opportunity to share, explain that this time, students will write the total number of counters they begin with and then subtract the number of yellow counters that are spilled.

Before beginning, model the activity for the group. You will be “Player A” and the class will act as “Player B”. Using a set of five or ten, spill the counters in the cup and identify how many yellow counters are shown. Then think aloud, “So, if I started off with 5 (or 10) counters, and there are _____ yellow spilled, how many red counters were spilled? How many more do I need to get to 5 (or 10)?” All students will use their math hands to predict how many red counters were spilled (scan to see who has made a logical prediction and those who’s prediction are illogical. Intervention may be needed for those that demonstrate a lack of number sense.). After all students make a prediction with their math hands, reveal the number of red counters that were spilled. Next, ask a volunteer to show the class how to write an addition and subtraction number sentence that would describe the situation you modeled. Encourage them to share their math thinking. Repeat this process until you feel that students are ready to practice this same activity independently (or with a partner).

Once students are ready, assign each student a number that is appropriate for their performance level and allow them to begin working. As you walk around to assess students, stop and ask the following questions (or those similar to assess student learning):

- What number did you start off with? So, if there are ___ yellow counters, how many red counters do you think there are? How do you know without counting?
TEACHER REFLECTION QUESTIONS

- Can students explain the strategies they used to determine how many red counters were spilled?
- What do the students notice about this version of this game that is alike or different from the addition version?

FORMATIVE ASSESSMENT QUESTIONS

- How do you know when your answer makes sense?

DIFFERENTIATION

Extension
- “Grab Bag Subtraction”-adapted (Burns 2007) Children can work in pairs or independently for this activity. Fill a paper bag with any set of tiles or cubes (to 5 or 10) and write the quantity of items in the bag on the front of the sack. Students will reach in the bag and take some out, showing how many were removed. Both students will predict how many they think are left inside of the bag. Then they will check their predictions and record the addition and subtraction number sentences.

Intervention
- Students may use a part-part-whole mat for this activity. Make sure that students flip the mat so that the “whole” section is first, showing that the one part is removed from the whole. An example of a part part whole mat can be seen below.

MGSE.K.OA.4 For any number from 1 to 9, find the number that makes 10 when added to the given number, e.g., by using objects or drawings, and record the answer with a drawing or equation.

MGSE.K.OA.5 Fluently add and subtract within 5.

STANDARDS FOR MATHEMATICAL PRACTICE

1. Make sense of problems and persevere in solving them.
2. Reason abstractly and quantitatively.
3. Construct viable arguments and critique the reasoning of others.
4. Model with mathematics.
5. Use appropriate tools strategically.
6. Attend to precision.
7. Look for and make use of structure.
8. Look for and express regularity in repeated reasoning.

BACKGROUND KNOWLEDGE

Students can develop and refine strategies as they hear other students’ descriptions of their thinking about number combinations. For example, a student might compute 4 + 5 by counting on from 4: "..., 5, 6, 7, 8, 9." But during a class discussion of solutions for this problem, she might hear another student's strategy, in which he uses knowledge about 5; namely, 3 and 2 make 5, and 5 more is 10. She may then be able to adapt and apply this strategy later when she computes 12 + 7 by saying, "12 and 3 make 15, and 4 more is 19" (adapted from NCTM Principles and Standards, 2012).

For more information about common misconceptions, please refer to the unit overview.

ESSENTIAL QUESTIONS

- Why is it important that I can build the number combinations for the number 5? 10?
MATERIALS

- 1 SUM-moning FIVES game board, per pair of students
- 5 double-side counters, per student
- 2 dice, per pair of students
- five frame

GROUPING

Partner task

TASK DESCRIPTION, DEVELOPMENT AND DISCUSSION

The first player rolls two dice and finds the sum.

After finding the sum of the two numbers, the student will decide what can be added to 5 to make the same sum. After a prediction has been made and explained, students model their explanation on the five frame board. If the student was correct, they place a double-sided counter over the equation that matches their prediction, and five frame explanation.

If the equation is not written, or if 5 cannot be used in an equation that is on the board, the player skips a turn to fill the board.

The two players alternate turns until the first player fills up his game board.

The person with the board filled first, wins!

Have students share with the whole group the strategies they used to identify how many more were needed to make a number (5 or 10). Were there situations in which they added more than two numbers or that they subtracted two numbers? If so, what were they? Challenge students to identify all the roll combinations where 5 or 10 can’t be made with 2 dice.

TEACHER REFLECTION QUESTIONS

- Do students use mathematical language to explain the strategies they used?
- Are students able to use various strategies to solve problems?

FORMATIVE ASSESSMENT QUESTIONS

- What strategies are you going to use to find the sum of two numbers?
- If you found sums higher than 5, what strategies did you use?

DIFFERENTIATION

Extension
• Change the game board to SUM-moning TENS and follow the same procedures as listed above.
• Teachers may also use activity 2.20 found on page 51 (Van de Walle & Lovin, 2006), “I Wish I Had”. After modeling this activity for students, have them work in pairs to play.

**Intervention**

• This game board can be changed to include only number combinations that are less than 5 or 10. For students who are not yet ready to work with sums beyond 5 or that are not yet proficient with using 5 as a benchmark.

PRACTICE TASK: Bo Beep’s Domino Dilemma  
Approximately 1-2 days

STANDARDS FOR MATHEMATICAL CONTENT

MGSE.K.OA.1 Represent addition and subtraction with objects, fingers, mental images, drawings\(^1\), sounds (e.g., claps), acting out situations, verbal explanations, expressions, or equations.

MGSE.K.OA.2 Solve addition and subtraction word problems, and add and subtract within 10, e.g., by using objects or drawings to represent the problem.

MGSE.K.OA.3 Decompose numbers less than or equal to 10 into pairs in more than one way, e.g., by using objects or drawings, and record each decomposition by a drawing or equation. (drawings need not include an equation).

MGSE.K.OA.4 For any number from 1 to 9, find the number that makes 10 when added to the given number, e.g., by using objects or drawings, and record the answer with a drawing or equation.

MGSE.K.OA.5 Fluently add and subtract within 5.

STANDARDS FOR MATHEMATICAL PRACTICE

1. Make sense of problems and persevere in solving them.
2. Reason abstractly and quantitatively.
3. Construct viable arguments and critique the reasoning of others.
4. Model with mathematics.
5. Use appropriate tools strategically.
6. Attend to precision.
7. Look for and make use of structure.
8. Look for and express regularity in repeated reasoning.

BACKGROUND KNOWLEDGE

Numbers are related to each other through a variety of number relationships. The number 7, for example, is 3 more than 4, two less than 9, composed of 3 and 4 as well as 2 and 5, is three away from 10, and can be quickly recognized in several patterned arrangements of dots. These ideas further extend to an understanding of 17, 99, and beyond. Number concepts are intimately tied to the world around us. Application of number relationships to the real world marks the beginning of making sense of the world in a mathematical manner (Van de Walle, 2010).

For more information about common misconceptions, please refer to the unit overview.
ESSENTIAL QUESTIONS

- How can I use different combinations of numbers to represent the same quantity?

MATERIALS

- Recording sheet (optional)
- Accessible manipulatives or dominos

GROUPING

Whole, individual and/or small group task

TASK DESCRIPTION, DEVELOPMENT AND DISCUSSION

Part I
If students have never been introduced to the game of dominoes, allow students to explore and play a couple of games before the task begins. Have students discuss the strategies they used during the game. (SMP 1-8)

Part II Memory
All the dominoes are placed face down. In partners, students take turns flipping over two dominoes where the total number of pips on the dominoes match. Students must find two different dominoes that have the same total (Example: one domino could have 3&2 and the matching domino could have 4&1). Once all dominoes have been matched up and no more matches are possible, the player with the most pairs of dominoes wins. (SMP 1-8)

Part III
Match players by ability level and have them take turns flipping over a domino. The first player to call out the total sum of pips on the domino wins. However, in order for the player to collect the domino, they must describe the strategy they used to their partner. (Example: 5&2 Student says “7, and I know that because 2 more than 5 is 7. If the domino was 3&0 the student might say “3, and I know that because any number plus zero is the number”).

After all the dominoes have been played, the player with the most dominoes wins. (SMP 1-8)

Part IV (to 5)
Introduce students to the task of 5 pips. Begin by discussing the vocabulary in the task and check for understanding.

Little Bo Peep loved to play dominoes. She had one domino in her pocket. The sum of the pips on her domino was 5. What could the domino in Bo Peep’s Pocket look like?

Comment: there are more than enough squares provided for the task to 5. This is used to make students justify that they have found all of the possible combinations. Many times students will
know they are complete when all the squares have been “filled up”, so by providing more than enough squares, this cannot occur. (SMP 1-8)

**Part V (to 10)**
Introduce students to the task of 10 pips. Begin by discussing the vocabulary in the task and check for understanding.

*Little Bo Peep loved to play dominoes. One day she had 2 dominoes in her pocket and the sum of the pips on her two dominos was 10. What could have been the two dominoes in Bo Peep’s Pocket?*

Comment: there are not enough squares provided for this task. Any additional combinations to ten that students identify should be recorded on the back of their sheet. (SMP 1-8)

**TEACHER REFLECTION QUESTIONS**

- How many number combinations were students able to make with 5 or 10?
- What did they notice about the combinations?

**FORMATIVE ASSESSMENT QUESTIONS**

- What ways are the different combinations you found? Why did you decide to do it this way?
- Are you sure that you have found them all? Why do you think so?
- Did you develop a shortcut to find your answers?
- Did you identify any patterns or rules?

**DIFFERENTIATION**

**Extension**
- Have the students identify which number of pips is the most frequent amongst the dominos.
- Have students make a make a conjecture (draw a conclusion) explaining why the number is most frequent.

**Intervention**
- Use a blank domino mat or folded piece of paper and give the student 5 or 10 counters. Have students create the domino using the template and counters. Students can then transfer model to the recording sheet.

[Back to Intervention Table]

PERFORMANCE TASK: The Bike Shop
Approximately 1-2 Days

STANDARDS FOR MATHEMATICAL CONTENT

MGSE.K.OA.1 Represent addition and subtraction with objects, fingers, mental images, drawings, sounds (e.g., claps), acting out situations, verbal explanations, expressions, or equations.

MGSE.K.OA.2 Solve addition and subtraction word problems, and add and subtract within 10, e.g., by using objects or drawings to represent the problem.

MGSE.K.OA.3 Decompose numbers less than or equal to 10 into pairs in more than one way, e.g., by using objects or drawings, and record each decomposition by a drawing or equation. (drawings need not include an equation).

MGSE.K.OA.4 For any number from 1 to 9, find the number that makes 10 when added to the given number, e.g., by using objects or drawings, and record the answer with a drawing or equation.

MGSE.K.OA.5 Fluently add and subtract within 5.

STANDARDS FOR MATHEMATICAL PRACTICE

1. Make sense of problems and persevere in solving them.
2. Reason abstractly and quantitatively.
3. Construct viable arguments and critique the reasoning of others.
4. Model with mathematics.
5. Use appropriate tools strategically.
6. Attend to precision.
7. Look for and make use of structure.
8. Look for and express regularity in repeated reasoning.

BACKGROUND KNOWLEDGE

In developing the meaning of operations, teachers should ensure that students repeatedly encounter situations in which the same numbers appear in different contexts. For example, the numbers 3, 2, and 5 may appear in problem-solving situations that could be represented by $2 + 3$, or $3 + 2$, or $5 - 3$, or $5 - 2$. Although different students may initially use quite different ways of thinking to solve problems, teachers should help students recognize that solving one kind of problem is related to solving another kind. Recognizing the inverse relationship between addition and subtraction can allow students to be flexible in using strategies to solve problems (NCTM Principles and Standards, 2012).

For more information about common misconceptions, please refer to the unit overview.
ESSENTIAL QUESTIONS

- How can I use different combinations of numbers to represent the same quantity?

MATERIALS

- The Bike Shop Recording sheet
- Bicycle cut-outs (if necessary)

GROUPING

Whole group, individual and/or small group task

TASK DESCRIPTION, DEVELOPMENT AND DISCUSSION

Part I

Begin by discuss bikes and bike shops with students. Allow students to share any experiences they have had with bikes. Specifically, discuss different types of bikes and what makes them different (focus on the wheels in particular). Ask the students the question “if I have 3 wheels sitting at home in my garage, what types of bikes could be in my garage?” Students will immediately say a tricycle but have them mentally explore possible combinations of bikes (unicycle and bike, for example). (SMP 1,2,3,6,7)

Part II

Give each student a workmat and picture sheet. Present students with the following task being sure to go over terms and understanding. For example, many students will know what a display case is, but not the formal name for it.

*The Bike Store sold unicycles, bicycles, tricycles and go-carts. The owner of the store could only fit a total of 5 wheels in the display case at the front of the store. What are the different combinations of bikes and go-carts that could be put on display in the front of the store? Explain and justify your mathematical thinking.*

(SMP 1-8)

Part III

Begin this part by allowing students to explore the possible combinations of bike wheels for number less than 10. Ask the students “if there were 5 wheels and 3 seats in the front display case, what could be in the display?” Students will struggle more with this concept because of the addition of a specific number of seats. As students work through this task watch for students that have more or less than 3 types of bikes. This would indicate that students don’t understand the purpose of the seats and how the number must remain constant. After students have solved this problem present the following task:

*The Bike Store sold unicycles, bicycles, tricycles and go-carts. In the front display case they are 10 wheels and 6 seats. What types of bikes are on display in the front of the Bike Shop? Explain and justify your mathematical thinking.*  

(SMP 1-8)
TEACHER REFLECTION QUESTIONS

- Can students explain the different combinations they found with each scenario?
- Were students able to use different strategies when solving problems?

FORMATIVE ASSESSMENT QUESTIONS:

- Are there more ways to decompose the number 5 or 10? Why did you decide to do it his way?
- Are you sure that you have found them all? Why do you think so?
- Did you develop a strategy to find your answers?
- Did you identify any patterns or rules?
- Are there any paired combinations to 5/10 that you were unable to model? If so, share your thinking.

DIFFERENTIATION

Extension

- Have students create a combination of bike wheels that are equal to 10. Partners play and try to identify the combination used by their partner.

Intervention

- Use clip art of unicycles, bicycles, tricycles, and go carts for students to manipulate and exchange one type of bike for another.
- For Part III (specific combination to 10), have students find any combinations to 10 that are possible and remove the restriction of 6 seats.

Back to Intervention Table

TECHNOLOGY

Math Games: Fruit Shoot Addition: Students add two numbers together and then choose the correct sum.
http://MGSEK.sheppardsoftware.com/mathgames/fruitshoot/fruitshoot_addition.htm
The Bike Shop

The Bike Store sold unicycles, bicycles, tricycles and go-carts. The owner of the store could only fit a total of 5 wheels in the display case at the front of the store. What are the different combinations of bikes and go-carts that could be put on display in the front of the store? Explain and justify your mathematical thinking.
The Bike Shop

The Bike Store sold unicycles, bicycles, tricycles and go-carts. In the front display case they are 10 wheels and 6 seats. What types of bikes are on display in the front of the Bike Shop? Explain and justify your mathematical thinking.
CONSTRUCTING TASK: Calling Out Reds!  
Approximately one day and repeated through centers (adapted from the Marilyn Burns activity, How Many Reds?)

STANDARDS FOR MATHEMATICAL CONTENT

MGSEK.OA.1 Represent addition and subtraction with objects, fingers, mental images, drawings\(^1\), sounds (e.g., claps), acting out situations, verbal explanations, expressions, or equations.

MGSEK.OA.2 Solve addition and subtraction word problems, and add and subtract within 10, e.g., by using objects or drawings to represent the problem.

MGSEK.OA.3 Decompose numbers less than or equal to 10 into pairs in more than one way, e.g., by using objects or drawings, and record each decomposition by a drawing or equation. (drawings need not include an equation).

MGSEK.OA.4 For any number from 1 to 9, find the number that makes 10 when added to the given number, e.g., by using objects or drawings, and record the answer with a drawing or equation.

MGSEK.OA.5 Fluently add and subtract within 5.

STANDARDS FOR MATHEMATICAL PRACTICE

1. Make sense of problems and persevere in solving them.
2. Reason abstractly and quantitatively.
3. Construct viable arguments and critique the reasoning of others.
4. Model with mathematics.
5. Use appropriate tools strategically.
6. Attend to precision.
7. Look for and make use of structure.
8. Look for and express regularity in repeated reasoning.

BACKGROUND KNOWLEDGE

“Children need many opportunities to identify quantities, see relationships between numbers, and learn about the operations of addition and subtraction. When developing beginning concepts of numbers, children benefit from exploring concrete materials and relating numbers to problem situations. They also benefit from talking about their ideas and hearing how other children think. The learning activities should be varied in their contexts and involve the children directly in thinking, reasoning, and solving problems.” (Burns 2007)

For more information about common misconceptions, please refer to the unit overview.
ESSENTIAL QUESTIONS

- Does the order of addends change the sum? How do you know when your answer makes sense?

MATERIALS

- Calling Out Reds? recording sheets
- Two different colored dice, per set of partners
- Anno’s Counting House by Anno Mitsumasa

GROUPING

Whole group, individual and/or small group task

TASK DESCRIPTION, DEVELOPMENT AND DISCUSSION

Refer to the book, Anno’s Counting House (Anno 1982) read in a previous lesson or “re-read” the book but pose different questions, such as, “What if the children moved in pairs instead of one at a time? What if there were three houses? What if there were more children? What else could be in the house to count? How many rooms, pictures, windows? What about your house? What about two classrooms or two buses instead of houses?” (Van de Walle & Lovin 2007) Have the children use counters to work out the story according to the new questions you pose.

Select two students to model this game for the class (or select two pairs of students and divide your class in half, so that a more intimate setting is provided for students to observe each pair of students playing the game. You could facilitate one group, your paraprofessional and/or collaborative teacher could facilitate the other.). The children will need twenty playing cards in all, consisting of ace through 10 of a red suit and black suit along with a recording sheet.

One child will mix up the cards, and deal them out, facedown, so that each child has 10 cards. Each student will count the number of red cards they have and write it on their recording sheet. Then, they will predict how many red cards their partner has so that they can make ten (show the students how to write the addition sentence). After each partner has written down the number of red cards they have and the number of red cards they predict their partner has to equal ten, they will check their work by each revealing the number of red cards they have. Have the pairs repeat this process until you determine that the whole group is ready to play. Once students are ready to play have students work with their math partner for this activity.

Invite each pair of partners to come to the whole group with their recording sheets. Make a class graph of the addends the children recorded. Analyze the graph and have students speculate about why some pairs of addends come up more often that others (Burns 2007).

Teacher Friendly Tip: Copy the addition and subtraction recording form back to back, laminate them (or use a sheet protector), and you have recording sheets that will last you a lifetime without making multiple copies! You will only need one class set. Students will use overhead
markers to record their answers. If you have a student on whom you are collecting data, make a copy before they erase their work and you have documentation of progress. (SMP 1-8)

**TEACHER REFLECTION QUESTIONS**

- Do students notice a pattern?
- Can students identify what pair of addends they have the most of? The least of?
- Are students able to determine how many more they will need to make ten, without counting?

**FORMATIVE ASSESSMENT QUESTIONS**

- Are there more ways to set the bikes in the display case?
- Why did you decide to do it his way?
- Are you sure that you have found them all? Why do you think so?
- Did you develop a shortcut to find your answers?
- Did you identify any patterns or rules?

**DIFFERENTIATION**

**Extension**

- Students can play *Make 10 on the Ten-Frame* (Van de Walle, Activity 4.8; Van de Walle & Lovin 2006) This activity can be adapted by changing it to “Make 5 on the Five-Frame” to keep the sum within ten. Use fact cards that have sums less than ten and give each student two five-frames to use to model each number on the fact card. Then, students should decide the easiest way to show what the total is, without counting. Take note as students explain their thinking of which strategies they are using—are they efficient strategies?

**Intervention**

- As students count their red cards, they could fill up a ten-frame with the corresponding number of counters. They would record that number on their recording sheet and then identify how many more are needed to make ten. The student should then check their predictions by actually counting out the number of red cards their partner has.

STANDARDS FOR MATHEMATICAL CONTENT

MGSE.K.OA.1 Represent addition and subtraction with objects, fingers, mental images, drawings\(^1\), sounds (e.g., claps), acting out situations, verbal explanations, expressions, or equations.

MGSE.K.OA.2 Solve addition and subtraction word problems, and add and subtract within 10, e.g., by using objects or drawings to represent the problem.

MGSE.K.OA.3 Decompose numbers less than or equal to 10 into pairs in more than one way, e.g., by using objects or drawings, and record each decomposition by a drawing or equation. (drawings need not include an equation).

MGSE.K.OA.4 For any number from 1 to 9, find the number that makes 10 when added to the given number, e.g., by using objects or drawings, and record the answer with a drawing or equation.

MGSE.K.OA.5 Fluently add and subtract within 5.

STANDARDS FOR MATHEMATICAL PRACTICE

1. Make sense of problems and persevere in solving them.
2. Reason abstractly and quantitatively.
3. Construct viable arguments and critique the reasoning of others.
4. Model with mathematics.
5. Use appropriate tools strategically.
6. Attend to precision.
7. Look for and make use of structure.
8. Look for and express regularity in repeated reasoning.

BACKGROUND KNOWLEDGE

Numbers are related to each other through a variety of number relationships. The number 7, for example, is 3 more than 4, two less than 9, composed of 3 and 4 as well as 2 and 5, is three away from 10, and can be quickly recognized in several patterned arrangements of dots. These ideas further extend to an understanding of 17, 99, and beyond. Number concepts are intimately tied to the world around us. Application of number relationships to the real world marks the beginning of making sense of the world in a mathematical manner (Van de Walle, 2010).

For more information about common misconceptions, please refer to the unit overview.

ESSENTIAL QUESTIONS

- How can I use different combinations of numbers to represent the same quantity?
MATERIALS

- Pencil
- Recording sheet
- Pennies

GROUPING

Whole group, individual and /or small group

TASK DESCRIPTION, DEVELOPMENT AND DISCUSSION

Part I
Review or introduce a penny, and discuss how both sides of the penny are different. Be sure that students understand which side is heads on the coin and which side is tails. Draw a chart that is similar to the Dropping Pennies recording sheet. Give each student 3 coins and have them explore all the ways that the coins can drop and record the possible combinations. DO NOT complete the chart. Take only a few combinations and then present students with Part II. (SMP 1-8)

Part II
Comment: there are more squares provided on the recording sheet than actual combinations. This is so that students can justify their answer.

Sam dropped 5 pennies on the ground. Some were heads up and some were tails up. How might the pennies have fallen? Show all the ways the coins could have landed on the ground.

In closing have students share the combinations they found and any strategies they used to solve the problem. (SMP 1-8)

TEACHER REFLECTION QUESTIONS

- Do students notice a pattern?
- Can students identify what pair of addends they have the most of? The least of?
- Are students able to determine how many more they will need to make five, without counting?

FORMATIVE ASSESSMENT QUESTIONS

- Are there any more was to decompose the number 5?
- Why did you decide to do it his way?
- Are you sure that you have found them all? Why do you think so?
- Did you develop a strategy to find your answers?
• Did you identify any patterns or rules?

DIFFERENTIATION

Extension
• Instead of giving the student 5 pennies, they could use 5 coins that have total value of 20 cents or less. At the end of the task, students would be asked to add up their coins and justify their total value using numerals, pictures, and words. This could be recorded on the back side of the page.

Intervention
• Have the students act out the problem by dropping pennies on the ground and recording the result. No result can be repeated. Because all combinations may never be the result of acting out this task, have the student determine the missing solution(s) through questioning.

Back to Intervention Table

TECHNOLOGY

PRACTICE TASK: Make 5 (Or 10) Go Fish! Back To Task Table
Approximately one day and repeated through centers

STANDARDS FOR MATHEMATICAL CONTENT

MGSE.K.OA.1 Represent addition and subtraction with objects, fingers, mental images, drawings\(^1\), sounds (e.g., claps), acting out situations, verbal explanations, expressions, or equations.

MGSE.K.OA.2 Solve addition and subtraction word problems, and add and subtract within 10, e.g., by using objects or drawings to represent the problem.

MGSE.K.OA.3 Decompose numbers less than or equal to 10 into pairs in more than one way, e.g., by using objects or drawings, and record each decomposition by a drawing or equation. (drawings need not include an equation).

MGSE.K.OA.4 For any number from 1 to 9, find the number that makes 10 when added to the given number, e.g., by using objects or drawings, and record the answer with a drawing or equation.

MGSE.K.OA.5 Fluently add and subtract within 5.

STANDARDS FOR MATHEMATICAL PRACTICE

1. Make sense of problems and persevere in solving them.
2. Reason abstractly and quantitatively.
3. Construct viable arguments and critique the reasoning of others.
4. Model with mathematics.
5. Use appropriate tools strategically.
6. Attend to precision.
7. Look for and make use of structure.
8. Look for and express regularity in repeated reasoning.

BACKGROUND KNOWLEDGE

“A mental computation strategy is simply an invented strategy that is done mentally. What may be a mental strategy for one student may require written support by another…As your students become more adept, they can and should be challenged from time to time to do appropriate computations mentally. Do not expect the same skills of all students.” (Page 161: Van de Walle & Loving, 2006)

For more information about common misconceptions, please refer to the unit overview.
ESSENTIAL QUESTIONS

• How can I solve and represent problem situations using objects, pictures, words and numbers?

MATERIALS

• 1 deck of playing cards for each pair of students, face cards removed (ten frame cards will also work for this game)

GROUPING

Partners and/or small group task

TASK DESCRIPTION, DEVELOPMENT AND DISCUSSION

Part I
Engage students in a discussion about the possible number combinations to make 10. After students have explored possible combinations, introduce them to Make 10 Go Fish.

How to play: The object is to get two cards that total 10.

• Each player is dealt five cards. The rest of the cards are placed down in the center of the table.

• If you have any pairs of cards that total 10, put them down in front of you and replace those cards with cards from the deck.

• Take turns. On your turn, ask the other player for a card that will go with a card in your hand to make 10.

• If you get a card that makes 10, put the pair of cards down. Take another card from the deck. Your turn is over.

• If you do not get a card that makes 10, take the top card from the deck. Your turn is over. (Example: Player 1 “Do you have a 2 in your hand?” If player 2 has a 2 they give it to player 1. If they do not have a 2 they say “Go Fish!”)

• If the card you take from the deck makes 10 with a card in your hand, put the pair down and take another card. Your turn is over.
Practice Task: YOUNG FARMER MACDONALD
Approximately 1-2 days

STANDARDS FOR MATHEMATICAL CONTENT

MGSE.K.OA.1 Represent addition and subtraction with objects, fingers, mental images, drawings¹, sounds (e.g., claps), acting out situations, verbal explanations, expressions, or equations.

MGSE.K.OA.2 Solve addition and subtraction word problems, and add and subtract within 10, e.g., by using objects or drawings to represent the problem.

MGSE.K.OA.3 Decompose numbers less than or equal to 10 into pairs in more than one way, e.g., by using objects or drawings, and record each decomposition by a drawing or equation. (drawings need not include an equation).

MGSE.K.OA.4 For any number from 1 to 9, find the number that makes 10 when added to the given number, e.g., by using objects or drawings, and record the answer with a drawing or equation.

MGSE.K.OA.5 Fluently add and subtract within 5.

STANDARDS FOR MATHEMATICAL PRACTICE

1. Make sense of problems and persevere in solving them. Students are able to compose and decompose numbers while solving problems involving addition and subtraction.
2. Reason abstractly and quantitatively. Students begin to draw pictures, manipulate objects, use diagrams or charts, etc. to express quantitative ideas such as a joining situation or separating situations.
3. Construct viable arguments and critique the reasoning of others. Students begin to clearly explain their thinking using mathematical language when composing and decomposing numbers. (Verbal and/or Written)
4. Model with mathematics. Students will begin to apply their mathematical thinking to real-world situations when given an addition or subtraction word problem.
5. Use appropriate tools strategically. Students will use manipulatives such as counting bears, cubes and number lines to model addition and subtraction problems.
6. Attend to precision. Students attend to the language of real-world situations to make sense of addition and subtraction problems.
7. Look for and make use of structure. Students begin to look for patterns and structure in the number system while exploring part-whole relationships using manipulatives.
8. Look for and express regularity in repeated reasoning. Students begin to recognize and use multiple strategies when combining and decomposing sets of numbers.
BACKGROUND KNOWLEDGE

In developing the meaning of addition and subtraction with whole numbers, students should also encounter the properties of operations, such as the commutativity and associativity of addition. Although some students discover and use properties of operations naturally, teachers can bring these properties to the forefront through class discussions (NCTM Principles and Standards, 2012).

ESSENTIAL QUESTIONS

- What happens when I decompose a quantity?
- How can I use different combinations of numbers to represent the same quantity?

MATERIALS

- Recording Sheet
- Accessible manipulatives
- Pictures of barn animals or toy animals (not included)

GROUPING

Whole/individual/small group task

TASK DESCRIPTION, DEVELOPMENT AND DISCUSSION

Part I

Engage students in a class discussion about the farm and possible animals that could be seen if they visited the farm. When discussing the animals, have students pay particular attention to the number of legs on each animal. Show the students the picture of the pigs’ feet. Give students think time and allow them to share their thoughts of what animal the picture could be showing and why there are only 10 feet in view with the person they were sitting next to. Question the students asking, what animal do those feet belong to? How many feet does one pig have? How many pigs could be in the picture? This task will really make students make sense of the problem. As students share their thoughts, the teacher records them on the board or chart paper so that the rest of the class can justify that their thoughts are accurate.

After students have been able to share their thoughts about the picture, reveal the rest of the picture showing the whole picture of the three pigs.
Introduce students to the following task and check for student understanding of what is being asked of them.

*Farmer MacDonald put all of her animals into different barns each night. Each barn could have no more than 10 feet. What animals did Farmer MacDonald put in her barn to equal ten feet? Find the different combinations of farm animals that equal 10 feet. Be sure to explain and justify your combinations.*

**Part II (What’s On My Farm)**

Have students create a specific combination of animals on the farm and play *What’s On My Farm?* Player 1 arranges a combination of animals and tells their partner how many legs and eyes they have on their farm in addition to the types of animals used.

- Example: The combination of animals on my farm is one goat and a chicken so I would tell my partner “I have 6 legs and 4 eyes on my farm. What do I have on my farm?”

- Example: The combination of animals on my farm is three goats and two chickens so I would tell my partner “I have 16 legs and 10 eyes on my farm. What do I have on my farm?” As students work through the extension ask them if they notice any patterns.

**Comment:** Students will know how many animals there are on the farm but looking at the number of eyes. (Example: if there were 6 eyes, there are 3 animals) This strategy should be identified by the students and not teacher prompted.

**FORMATIVE ASSESSMENT QUESTIONS**

- Are there any more ways to decompose the number 5? How do you know?
- Why did you decide to do it this way?
- Are you sure that you have found all of the ways? Why do you think so? How do you know?
- Did you develop a shortcut to find your answers?
- Did you identify any patterns or rules? Explain!
DIFFERENTIATION

Extension
- Give students 3 numbers (1, 5, and 10). Ask students to make the number 20 using only the given 3 numbers. Some possible combinations could be 10+10 or 10+5+1+1+1+1+1.

Intervention
- Print out pictures of farm animals or use animal figurines to manipulate while trying find out the correct combination of farm animals. You could also give students a specific number of animals that were in the barn which would limit the possibility of combinations.

Back to Intervention Table
Young Farmer MacDonald

Farmer MacDonald needed to put all of her animals into different barns each night. Each barn could have no more than 10 feet. What animals did Farmer MacDonald put in her barn to equal ten feet?

Find the different combinations of farm animals that equal 10 feet. Be sure to explain and justify your combinations.
PRACTICE TASK: Four Sums in a Row
Approximately one day and repeated through centers

STANDARDS FOR MATHEMATICAL CONTENT

MGSE.K.OA.1 Represent addition and subtraction with objects, fingers, mental images, drawings, sounds (e.g., claps), acting out situations, verbal explanations, expressions, or equations.

MGSE.K.OA.2 Solve addition and subtraction word problems, and add and subtract within 10, e.g., by using objects or drawings to represent the problem.

MGSE.K.OA.3 Decompose numbers less than or equal to 10 into pairs in more than one way, e.g., by using objects or drawings, and record each decomposition by a drawing or equation. (drawings need not include an equation).

MGSE.K.OA.4 For any number from 1 to 9, find the number that makes 10 when added to the given number, e.g., by using objects or drawings, and record the answer with a drawing or equation.

MGSE.K.OA.5 Fluently add and subtract within 5.

STANDARDS FOR MATHEMATICAL PRACTICE

1. Make sense of problems and persevere in solving them.
2. Reason abstractly and quantitatively.
3. Construct viable arguments and critique the reasoning of others.
4. Model with mathematics.
5. Use appropriate tools strategically.
6. Attend to precision.
7. Look for and make use of structure.
8. Look for and express regularity in repeated reasoning.

BACKGROUND KNOWLEDGE

As your students play this game, encourage them to use what they know from previous activities about number combinations to 5 and 10, and also what they know about using 5 and 10 as benchmark numbers. Young children often initially compute by using objects and counting; however, prekindergarten through 2nd grade teachers need to encourage them to shift, over time, to solving many computation problems mentally or with paper and pencil to record their thinking. Students should develop strategies for knowing basic number combinations (the single-digit addition pairs and their counterparts for subtraction) that build on their thinking about, and understanding of, numbers. Fluency with basic addition and subtraction number combinations is a goal for the pre-K–2 years (NCTM Principles and Standards, 2012).

For more information about common misconceptions, please refer to the unit overview.
ESSENTIAL QUESTIONS

- Does the order of addends change the sum?

MATERIALS

- 1 Four Sums in a Row game board, per pair of students
- 2 clothespins
- 24 double-sided counters, per set of partners

GROUPING

Partner task

TASK DESCRIPTION, DEVELOPMENT AND DISCUSSION

The first player places the 2 clothespins at the bottom of the game board and covers two addends. Player combines the addends and places a yellow marker over the sum.

The other player moves only one of the clothespins to a new addend and covers the sum with a red marker. Both clothespins can cover the same addend.

Play continues with pairs alternating turns, moving one neutral counter each turn until one player has four markers in a row (horizontally, vertically, or diagonally)

Have students share with the whole group the strategies they used to identify how many more were needed to make a number (5 or 10). Were there situations in which they added more than two numbers or that they subtracted two numbers? If so, what were they? (SMP1-8)

TEACHER REFLECTION QUESTIONS

- Are students able to develop a strategy to combine two addends and determine the sum? Able to combine two addends with a sum greater than 10?
- Are students able to describe the strategies they used when combining addends using mathematical language?

FORMATIVE ASSESSMENT QUESTIONS

- What strategies are you going to use?
- What strategies did you use to get four sums in a row?
- If you found sums 11 and/or 12, what strategies did you use?
DIFFERENTIATION

Extension
- Activity 2.20, page 51 (Van de Walle & Lovin, 2006), “I Wish I Had”. After modeling this activity for students, have them work in pairs to play.

Intervention
- This game board can be changed to include only number combinations to 5 or 10 for students who are not yet ready to work with sums beyond 10, or are not yet proficient with using 5 as a benchmark.

Back to Intervention Table

Whole group, individual and/or small group task

**TASK DESCRIPTION, DEVELOPMENT AND DISCUSSION**

Begin by reading *Penny Pot* (or a similar book) to the class and introduce the task. In this task two sisters go to the candy store and their mother has given them a nickel to spend. The sisters spend the whole nickel and each of them buys a piece of candy. Students must determine all of the possible combinations of candy they could buy. Be sure to discuss vocabulary and clarify any misconceptions students may have with the task.

Emma and Audrey went to the candy store and they had 1 nickel to spend between the two of them. If they spent the whole nickel and each got 1 item from the candy store, what are some of the items they could have bought?

(SMP 1-8)

**TEACHER REFLECTION QUESTIONS**

- Do students understand that 1 nickel is the same as 5 cents?
- Are students able to decompose 5 in more than one way?
- Are students able to describe the strategies they used to solve the problem in mathematical language?

**FORMATIVE ASSESSMENT QUESTIONS**

- Are there more ways to decompose the number 5?
- Why did you decide to do it his way?
- Are you sure that you have found them all? Why do you think so?
- Did you develop a shortcut to find your answers?
- Did you identify any patterns or rules?

**DIFFERENTIATION**

**Extension**

As an extension to this activity the amount of money and/or candy purchased could be increased. In addition, students could find all the possible combinations of candy that...
could be bought using the entire nickel. In this extension more than two items can be bought. Example:

- 5 suckers
- 1 lollipop and 3 suckers
- 2 lollipops and 1 sucker and 3 apples

Some students may realize that they can have as many apples as they want and the amount of money spent does not change the total. The zero property can be discussed ONLY IF IT IS IDENTIFIED BY THE STUDENTS.

**Intervention**

- Allow students to work through the stages at a speed that is appropriate for their abilities. Some students may need additional experiences acting out problems, using manipulatives, or drawing pictures.
- Students can use cut out pictures of candy and physically place them in combination pairs that make 5.
- Students that have difficulty fixing a quantity to the candy can have the cost of each item written on the picture.

**TECHNOLOGY**

Math Games: Pop Up Addition:  Students solve addition problems by adding two numbers together.

Student Work Samples
Kindergarten  
Unit 4 Investigating Addition and Subtraction  
Task: Dropping pennies  
(Instead of pennies we used 2 colored manipulatives)
MGSE.K.OA.3 Decompose numbers less than or equal to 10 into pairs in more than one way, e.g., by using objects or drawings, and record each decomposition by a drawing or equation (e.g., 5 = 2+3 and 5 = 4+1)
There were 3 ladybugs sitting on a leaf. Two ladybugs joined them. How many ladybugs in all?

\[ 3 + 2 = 5 \]

I drew 3 ladybugs. Plus 2 more. 

\[ 2 + 3 = 5 \]

I did 3 do the same. 3 in and 2 more the same.
There were 3 ladybugs sitting on a leaf. Two ladybugs joined them. How many ladybugs in all?

I start with 3 and put 2 more ladybugs.

\[3 + 2 = 5\]

\[2 + 3 = 5\]

I start with 3 and put 2 more.

\[3 + 2 = 5\]

\[2 + 3 = 5\]
